California Horticulturally

SAVE THE BIRDS.

WE NOTE the usual outcry from some sources against birds, — and the meadow lark especially is being condemned, many farmers claiming that it is taking all the sowed grain out of the soil. We do not know how far the charge is true, but it is a fact that birds are one of the greatest balances in nature, and that without them we should be devoured by insect pests. Some birds are both frugiverous and insectivorous, others gramniverous and insectiverous, but in either case grain or fruit is a diet resorted to largely when there is a scarcity of their natural insect food. The meadow lark is one of the best of the insect eating birds, and its work in the soil is largely in search of the larvae of insects which would destroy the grain roots were they not removed. The English sparrow is another bird which is severely denounced, and hasn't got a friend in the town, yet we have watched these little fellows by the hour after sundown and seen them catch injurious moths by the hundred, catching them on the wing as they darted past. The Phoebe, the wren, and, in fact, the great part of our common birds are more beneficial than injurious, and in killing them off we shall destroy the balance of nature and have to resort more and more to the more costly and expensive method of fighting our insect pests by artificial means.

PROFIT IN FIGS.

Since the introduction and the successful establishment of the fig wasp, through the efforts of George Roeding, and which has made possible the production of figs in California equal to the best imported from the Mediterranean, the culture of this fruit has taken rapid strides, and is growing in popularity each year. This season there have been very large new areas set out to figs in both the Sacramento and the San Joaquin valleys. The Smyrna fig is a very delicate fruit and subject to sudden changes of temperature. It will not give as good satisfaction in the coast counties as in the interior valleys for this reason. On the coast the sea breezes modify the temperature, and the evenings are cool as soon as the sun is down. In the interior the evenings do not cool off so suddenly and the fig grows unaffected by the change. Conditions here are perfect for it and from present prospects it will not be long before California will produce all of this fruit that will be demanded in the United States and have a surplus for shipment.

A NATIONAL HORTICULTURAL QUARANTINE.

The fruit growers of the State at their convention have given an endorsement to a national quarantine on all imported vegetation, in order that our orchards may be more effectively safeguarded from imported pests. A strong resolution was offered at the last convention at Marysville, and this was sent to all the members of our delegation in Washington. We note that Senator Perkins has submitted these resolutions to the senate and that they have been referred to the Committee on Agriculture, of which the senator is a member. It is not improbable, therefore, that some action in the matter will now be taken. If could have a good entomologist s tion at each port of entry in t United States with the assurance t all imported plants and trees w be conscientiously inspected be admission, we should be well as against the introduction of any foreign pests of our orchards.

DESTRUCTIVE WORMS IN PA TURES.

There is a very serious and usual plague of crane flies in the tures of many sections in the no ern part of the State this sea These pests in their larval state a pear as grubs in the soil and about half an inch in length; t feed on the grass roots, and are thick in many cases that the gr has been killed out, and the spots which it is worst look as though th had been swept over with a blast. Like all subterranean pe the larvae of the crane fly is v hard to reach, as it is protected the covering of soil, and working, it does in the heavy grasses, is v difficult to get at. In cases where is so bad as to destroy the gra in grain fields, for it is often d tructive here also, plowing in June an July is advisable. This exposes larva to the hot sun and kills them subsequent treatment of gas li from three to four tons to the acre, also effective.

SPRING FRUIT GROWERS' CONVENTION.

It has been definitely announc that, in accordance with the res tion passed by the last Fruit Grow Convention at Marysville, a s session is to be held and Riv has been selected as the place will open on Tuesday April 2 continue until May 1st. A mo cellent working committee ha matter now in hand, and there question but that this will be o the most instructive and best at ed conventions ever held in thi of the State.

NO DANGER FROM OVERPROD TION.

The cry of overproduction is a indication of market condi When there is a poor market small prices, we always think the other fellow should dig up vines and trees, and that all t who think of going into the business should be warned to When, however, there is a good ket, we forget the bugaboo of production and the cry is not So, for a year past, we hav heard of overproduction in frui it is a fact that, with all our o California was not able to supp demand. Prices have been good, a those who had fruit for sale h made money. There has been a l impetus given to new planting a the fruit growing acreage of t State will be very largely increas Markets will fluctuate, seasons w differ, some will be good and so poor, and this will be the case whe er we grow much or little fruit; b taking one year with another, a fruit growing properly attended will pay and not until every one the country has all the fruit he she may want will there ever be d ger of overproduction.

ueries and Replies

estions to be answered in this department should be received at this office e week before reply is expected. Write plainly on one side of the paper and n full name and address. Unsigned communications receive no attention.— d.

h.

nclose a plant which is growing g my stock beets in sandy soil. t is it and is it valuable to the C. E. G., Hynes.

e plant which you send is a vetch is so valuable that it is large- sed as a cover crop in deciduous citrus orchards. The seed is ly secured from the North though found in practically all sections e State. To secure its greatest it has, of course, to be grown turned under, where it is allowed cay in the soil.

er Coat.

ase tell me what oil to put on a slicker coat and how to apply it top the leak."—Sulphuret, River-

e are unable to give the informa- desired and ask any reader of the vator who can help the inquirer, mmunicate. One suggestion has made that fish oil applied would mplish the work, but we imagine dor would be such that the wear- ould not be received into polite ty.

ers.

ase give the best remedy for de- ing pocket gophers. Also how I rid my place of Johnson grass? d that I can dig it out of the nd and lay it on the fence where ill dry for weeks, and if blown y the wind it will sprout and . My patch is only about 6 feet re and I do not wish it to spread more.—Subscriber, Fortuna.

bscriber is asking two very hard tions, and we can only give hints h may be of value. The gopher be destroyed by traps, which is surest, and likewise the slowest, s we answered recently, in these mns, by poisoning by a very small tity of strychnine in the center of isin or in a slit or a freshly cut to. Be sure and not make the to bitter by getting any of this de. Insert the poison baits in the and close. Another method is by ing the pest to death with a er smoker. This works very well ground squirrels, while with ers it is not so successful, though e maintain they have succeeded y well. It is persistent work that mplishes results with the gophers.

garding Johnson grass it is best to use a weed cutter or even to go ugh the bunch of grass as the s dragged out are carried and thus tered over a large area. If we had, he writer says, only a six-foot h, we would go through it two or e feet deep in the ground with el and a screen, taking up every particle of root possible to find. ould cost something, but would ent vastly greater cost in the fu- . If the location is such that you not care for the use of that par- lar portion of the ranch for a few s you can cover a few inches deep cheapest grade of salt to be se- d. This treatment has often been n to wild morning glory, but is lc, for, bear in mind that any such tment you give to eradicate the will likewise kill any other plant he same soil.

Beet Tops.

Please answer through your valuable columns: Does feeding sugar beets with tops on have a tendency to dry up milch cows? W. W. L., Gridley.

No, it was the sugar beet tops that first filled the silos of Germany. There is no better feed than beets for cows. The drying is probably due to the cows not receiving enough nutriment from the watery character of the food. Give them some good alfalfa or other hay with the beets. If they will pay for it, feed some grain.

Worms.

My mare is badly troubled with worms. Is with foal. Will administering remedies have any risk? Is very hard to drench. Can I give remedy in feed? What is remedy? T. H., Los Angeles.

Go to the drug store and buy some of the Humphreys remedies. These are added to the grain feed. M. E. S.

Grapes on 'Dobe.

What kind of grapes is best to plant on land 2½ miles from Santa Rosa on heavy adobe land? Subscriber, Santa Rosa.

For table grapes, we would plant Purple Cornichon. For white wine grapes we suggest Petite Sirah, Cabernet Savignon, Tennat, Serine, Mondaus and Blue Portuguese. For white wine, Semillon Colombar, Savignon Vert, Sauvignon blanc, Franken Riesling, Johannisberger and Traminer. This wine list has been recommended by Prof. F. T. Bioletti, who has been over the whole wine-growing districts of the State and is familiar with the conditions.—J. W. M.

Kraut.

Please tell me how to make sauer kraut? Also how to plant and grow asparagus.—C. M., Arroyo Grande.

First scald your stand, cutter, stamper and tub. Remove the outer leaves of cabbage, cut in halves, remove heart, and then cut. Lay some clean leaves in bottom of stand (vessel for holding kraut,) sprinkle with handful of salt, put in half bushel of cut cabbage, stamp gently until juice just appears, then add another handful of salt; and so on until the stand is full. Cover with cabbage leaves, put a clean board on top that fits snugly, and on this a heavy stone. Keep in cool cellar. Ready to use in about six weeks. Cut the cabbage coarse.

Poisonous Plants in Pasture.

Can you give information as to poisonous plants in pasture? H. E. T., Metz.

Mrs. Sherman says she has no experience on this line. Can any subscriber give information? Of course, all know of rattle weed, which some have carefully removed from pasture when horses frequent it.

Sore Ear.

I have a cat which suffers from sore ears. Will you kindly let me know what to do for her? The hair is all off and evidently they itch badly, as she scratches often until they bleed. I have been treating with an ointment used for sore shoulders on work horses. D. P. W., Moorpark.

We infer this trouble is entirely on the outside and that an application of

SEEDS Trees Plants

If you are interested at all in gardening or farming, for pleasure or for profit, it will pay you to send for our new catalogue of best seeds and plants. It is well illustrated, describes all varieties, and gives the best cultural directions for our climate.

LIVERMORE NURSERIES. In our Livermore Nurseries we grow our choicest stock of plants and trees and call your attention to a fine lot of Muir Peaches, French Prunes, on both Almond and Myrobolan roots, Orange and Lemon Trees.

ALFALFA SEED

We are the largest dealers in Alfalfa on the Pacific Coast. Our entire stock of new crop Utah Seed is in hand and as the crop is extremely short we advise you to order early for the supply is sure to be exhausted before the planting season is over.

Successors to Cox Seed Co.

Send for our CATALOGUE, it will tell you about all the good things we have which you ought to plant.

C. C. MORSE & Co.

44 Jackson St. San Francisco

SEED

of Highest Quality

"THE BEST THAT MONEY CAN BUY."

Try our specially selected strains of all vegetable, tree and flower seed. No one can secure a better quality. Absolutely all fresh.

ROCKYFORD MELON.

Morris & Snow's—Special selected for shape and size.

Every melon picked in best season, and carefully selected. One pound, sealed packages, $2.00; one-fourth pound, 60c.

A very fine strain of this melon, 90c per pound.

WATER MELON—Chilian—(The most perfect melon on earth).

Morris & Snow's special selected stock.

Every melon was perfect and picked in early season. No "cull melon" seed go into our stock. When cut, every melon was carefully examined and if not up to standard was rejected. This extra select stock in sealed packages, at $1.50 per pound; one-fourth pound, 40c.

EUCALYPTUS Seed and plants in any quantity. Call or write for our Catalogue.

TREES

Every Tree True to Name

LARGEST STOCK ON THE COAST

When you buy trees you surely want trees of known value; strong and thrifty with well developed roots and every one true to name. Our 25 years' experience and our perfect methods of growing and handling enable us to guarantee our trees.

Plant Trees for Profit

A good orchard is an excellent investment and if well cared for will earn immense profits. We can give you valuable suggestions regarding the most advisable trees to plant, and can furnish you with the finest nursery stock obtainable.

Place your orders at once and get your trees in the ground as early as possible.

Burbank's New Creations

Luther Burbank has done more than any other man in this country for the betterment and propagation of superior fruit products. We are sole propagators and distributors for all of Burbank's new creations and now have seven of his valuable new tree products ready for market in limited quantities. Send 10c for our beautiful Burbank booklet, illustrated in natural colors, telling all about them.

Oranges
Lemons
Limes

Our nurseries comprise over 1500 acres in the most fertile sections of California and our trees are grown in these different locations where the soil is best suited to their perfect development.

You Should Have Our Catalogue

Write Today—Free on Request

Our catalogue is the best book of its kind ever published on the coast. Contains 148 pages of illustrations and valuable information about nursery stock and trees of all kinds. If you are interested in trees you should send for it at once. We mail it free to any address.

Established 1884. Paid Up Capital $200.000.00

Fancher Creek Nurseries (Inc.)

Geo. C. Roeding, Pres. and Mgr.

P. O. Box 12, Fresno, California

4 per cent. solution of creolin, also of carbolized vaseline or any carbolic salve will be good. If the interior of the ear is affected drop in sweet oil in which a small quantity of eucalyptus oil has been mixed.

Contagious Abortion.

Please give something in your paper as to contagious abortion and also any way to prevent it. I have also a young horse troubled with worms. How can I rid it of them? M. G., Ferndale.

The Cultivator of October 10, page 344, gave instructions regarding the handling of the first-mentioned trouble, but in a word you should at once remove the animal that is troubled from all stock, keep the stables thoroughly cleaned, using abundance of lime scattered about, washing the animal affected with an antiseptic solution of cresol of 2 per cent. strength. A douche may be administered and thorough external cleansing should also be given occasionally.

Regarding worms affecting the horse it is difficult to give any definite advice until more is known, as there are many varieties infesting stock. But assuming it is an intestinal worm proceed as follows: After a fast administer twice daily for two or three days a drench composed of turpentine or creolin one ounce, linseed oil two or three ounces to be followed on the fourth day by a physic of Barbadoes aloes one ounce, Or you may give santonin two to four drams with calomel one to two drams. This does not need to be repeated, but to be followed in six hours by a quart of linseed oil.

Bermuda Grass.

What is the best way to get rid of a patch of Bermuda grass? Will distillate kill it? And how much will I have to put on and would it kill peach trees that are growing in the Bermuda?—W. B. E., Rudley.

We do not think it advisable to use distillate. If used in quantity to kill the grass it would unfit the soil for the peach trees as well. Thorough cultivation will do it. But it must be thorough and often. The writer once had a patch of it in an orchard which was eradicated in one season. A hydrant, with a barrel under it, had encouraged its growth for a patch about a rod square. The barrel and the pipe were removed and though the old sod was thick and tough, a stout team, with good, sharp cultivator teeth, had it completely killed out in a few months. But, bear in mind, that spasmodic going at it with a vengeance one day, then allowing it to grow for several weeks again will not accomplish it. Give it a weekly cultivation.

Gypsum.

I notice in queries and replies in a recent issue, that you advise 1000 pounds of gypsum to an acre of alfalfa. Now, here in Stanislaus ocunty we do not use more than 100 to 200 pounds to the acre and with good results.—D. F. Conant, Modesto.

Renewing Lemon Trees.

May I trouble you to give me advice regarding my lemon trees? I recently bought the place with 15-year-old trees—Eureka and Villa Franca. They have been neglected and are badly infested with scale, which has been attended to by fumigation. I have also fertilized, but am at a loss as to pruning. Some say cut heavily, others only remove suckers.—R. S., Fillmore.

The article by Mr. Jones in the issue of February 13, is the best answer to the above. We would not "cut heavily" nor would we be tent with only keeping out the s ers and keeping fairly clean brush. Follow Mr. Jones' inst tions, or better get experience working with experienced prun for pruning cannot be picked up once.

This orchard would doubtlessly greatly benefited by deep plowing a heavy cover crop next season.

Electrical Alarm Thermometer.

A subscriber wishes to know wh to secure the electric alarm mometer.

The only one which we know o the Bolton alarm, which may be by addressing J. P. Bolton, Fresn

Securing Patent.

Will you please answer the foll ing questions through your valu paper: Is it really necessary to tain an attorney in getting a pate Are there any other patent office the United States besides at Wash ton, D. C.? Are there reliable pa attorneys in Los Angeles; if would you kindly give their na and addresses?—M. L. H.

It is not necessary to have an torney. But unless one understa the entire procedure, we doubt there would be more cost and liab to error and consequent loss w would more than offset the attorn fees. Hence we would by all n employ an attorney. There is b one patent office. There are rel a patent attorneys in Los Angeles. James R. Townsend, 428 Bradb Building, is entirely reliable

Old Cans for Plants.

In the "Cultivator" of Jan. 3 1908, I saw an article from J. C. Ontario, asking for a practical m od of handling small plants. I w like to give my experience in line, which may also be beneficia others:

I take tomato cans, corn cans condensed milk cans or even s lard buckets, melt off both leaving nothing but the ring or of the can, set them in some venient place and nearly fill w finely pulverized soil or fine and plant your seed, two or thre a can. I slip my rose bush cut grape cuttings, in fact, everyt in the cutting line, tomatoes, cuc bers, etc. When time for plan slip a spade under the can, carr to where it is to be planted, sl knife blade inside the can to free soil from the can; set the plan the ground, pack the earth clo the can and carefully remove the up over the plant, and the p will never know that they have disturbed. These rims or cans be used two or three times.—Mr L. Ownbey..

Cottony Insect.

I have a tree with an insect w looks like a small bit of cotton breaking find it has red eggs in i the ladybugs works on it; som it cottony cushion. Is it harmfu the trees or grove? I see no ence in the tree yet. Answer t questions through your paper.—C R., Lindsay.

Is it a citrus tree? If so, it may cottony cushion scale. In that c send to the State Horticultural C missioner at Sacramento a sampl it and he will return to you a col of the little vadalia, which will c out the pest to the queen's taste

Spray for Codling Moth.

Can you give me informa through the Cultivator about spray apple trees? When should I sp How is the liquid for spraying m is this spray good for woolly s where it is on the branches of trees? Also is there any danger etting poisoned by eating apples trees that were sprayed when in som?—A Subscriber.

r codling moth spray when bloom ropping, with one pound Paris n, three pounds lime and 200 gal- of water or three pounds arsenate ead, 50 gallons of water.

hat should be followed in two or e weeks with another application. re is no danger from eating the ap- of sprayed trees. This would be o value on the aphis. For that y with kerosene emulsion or le oil soap.

ter Sprouts.

have a three-year-old orange e that has a growth I call water ut or straight growth on the body also on the large limbs, a quick th that will get from six to eight long. Should they be cut out or ? Answer through your paper.—A scriber, Lindsay.

eep water sprouts off the tree n they are young, say one to two long. If they are allowed to grow and monopolize the tree, then it is etimes best to remove the remain- of the tree, but this only in rare s. Keep them out before they to be so large.

fting Walnuts.

ill you kindly favor me with your ion as to whether it would be ad- ble to bud a two-year-old seedling lish walnut orchard to a good ted blight-resistant variety? What ety would you recommend, and re could likely obtain the buds cions.—H. A., Los Angeles.

would be best to graft over your nuts to resistant stock, but we do think scions can be had this year all that propose to begin that k. However, you will lose nothing keeping your trees in a vigorous dition for another year or two rs, if you do not find resistant ns sooner, as they will be making ts and the top will soon form when scions are once in place.

d for Young Work Horses.

ill some one who has had actual erience in feeding young work ses barley, reply. Have two very heavy horses three years old in il which we have broken to work, wish to take the best of care of m. How often should they be fed ley and how much? Fed only on lfa hay.

e do not think the alfalfa will be nd satisfactory for the work horse. d barley and wheat hay. As to erience with young horses on in, will ask our subscribers to send experience as to amount. A work- horse should surely have some in, though we have seen a team do t work on good barley hay.

d Bed for Sweet Potatoes.

ill you please tell me how to pre- e a seed bed for sweet potatoes? many potatoes will be required an acre of ground? How far apart uld the plants be set in the row? ee article in issue of February 13.

ipping Grape Vines.

want to buy roots of Muscat grape es to be shipped from the counties th of Tehachepi, probably Placer ., to San Diego county.

o you know of any reason why h vines cannot be shipped and de- ered as aforesaid? If there is any son, what will it be necessary for to do to get such vines? Is there one south of Tehachepi who sells h rooted vines?—Subscriber, San go.

he vines will have to be insepcted the receiving station by the county pector. If you do not know who the inspector is of your district write the County Horticultural Commissioner at San Diego and get instructions. There are nurseries advertising in Cultivator handling such vines.

You should buy subject to their passing inspection by your own county inspector.

LEATHER INDUSTRY AND THE FOREST.

No other nation produces half as much tanned, curried and finished leather as the United States, which yields over one-fourth of the world's supply. Six hundred and seventeen tanneries contribute to this output. The raw material includes a hundred and eight million hides and skins, including a large number from Argentina. To tan this immense quantity of leather, valued at over 250 million dollars, last year required over a million and a quarter cords of tanbark, worth nearly $13,000,000, and more than six hundred and fifty thousand barrels of tanning extract, worth $8,700,000.

Over two-thirds of the tanbark consumed comes from hemlock, and over one-fourth from oak; chesnut and other woods contribute the remainder. More extract is secured from chesnut, however, than from all other domestic woods combined. A small quantity of extract of a little over a thousand barrels comes from the roots of palmetto.

Although the tanning industry is widelly distributed over the United States, the greater part of it is carried on in the States of Pennsylvania, New York, Michigan and Wisconsin, which use more than two-thirds of the tanning materials consumed. Pennsylvania alone consumes over nine hundred million pounds of bark and extract worth $8,000,000, or 37 per cent of the total value.

Since 1900 the quantity of tanbark used has fallen off 15 per cent, although its value has increased. During this period the consumption of extract increased from $67,000 to 660,000 barrels a year, of which nearly 90,000 barrels were imported. Relatively small quantities of hemlock bark were imported from Canada, and of mangrove bark from the West Indies and Africa. In weight, four times as much quebracho was imported in bark as in extract form, but the value of the two forms was about the same.

Bark brought the lowest price in New Hampshire, and the highest in Oregon, with an average of $9.30 per cord. More than in bark the price of extract varied widely according to the material from which it was manufactured. The extract of quebracho, a tree of Mexico, Central America, South America and the West Indies, from which seven-eighths of all imported tanning materials are secured, had an average price of $18 per barrel; and hemlock brought $12.60 per barrel; oak $9.90 per barrel and chesnut $9.12 per barrel.

Statistics of the consumption of tanbark and tanning extract in 1906, gathered in co-operation with the Bureau of the Census, are given in Circular 119 of the Forest Service. This publication can be had upon application to the Forester, U. S. Department, Washington, D. C.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

TAX REDUCTION.

Alabama has been in the limelight with her temperance legislation during its recent special session. That same special session passed another admirable law, which provides that if owners of timber tracts, when cutting them for lumber, will refrain from felling trees of any smaller diameter than twelve inches, and will preserve the land afterwards for reproduction of the forest, they shall be allowed a smaller rate of taxation while the second crop of timber is growing. A list of these lands is to be filed with the State Tax Commission. Provision will also be made to encourage the growing and planting of timber.

This action is in harmony with the government plan to make provisions for the Appalachian National Forest, which will extend into the northern section of Alabama. The idea as formulated, however, makes forest preservation a State-wide scheme, in which small and large land owners are to be equally encouraged. By its workings it is hoped that hundreds of thousands of cut-over timber lands will be cared for and replanted, and come into productiveness again in ten or twenty years.

The Utah State beekeepers are to meet at Salt Lake City, April 6th. There will be an election of officers and discussion of matters of interest to the industry.

It is reported that more extensive plantings of pineapples will be made this year in the Hawaiian Islands than ever before.

THE BROWN BOOK.

One of the best things that ever happened to the irrigator was the invention of the "K T" valve, which was invented by Messrs, Kellar & Thomason, practical irrigators and manufacturers of cement and other irrigation appliances. When first invented the manufacture was taken up in a very small shop on the ranch, but more recently, as will be shown by engravings which the Cultivator hopes to give later, fine, large shops were erected in the city of Covina. This has come about through the fact that these appliances are so perfectly adapted to complete control of the water with most economical handling, that the sales have been extended beyond precedent.

The needs of irrigators have been continually anticipated and until now the slogan of the firm is "everything for the irrigator." This valve should be seen to be appreciated, but in case you are some distance away, a card dropped to the Kellar & Thomason people at Covina will bring descriptive and illustrative matter, which will give a very clear idea. Especially would we advise you to ask for their "Brown Book." It is entitled irrigation and gives some little information regarding the valves in question and also valuable details regarding capacities of pipe which aid one in determining the size of pipe to carry in a given head.

USE OF CALIFORNIA PRODUCTS IN HOTELS.

In his address before the San Francisco Hotel Men's Association, at its banquet held at the Hotel St. Francis in San Francisco on the evening of February 8, on which occasion about two hundred hotel men from all parts of the Pacific Coast were present, Dr. Clarence E. Edwords of the California Promotion Committee, spoke of the great benefit hotels could be to the State if they would pay more attention to giving good fruit and wine and other distinctively California products to their guests at low rates. He said in part:

SOME TALL CORN.

"A grevious complaint is frequently heard from visitors to California against our hotels because they serve poor fruit and charge high prices for it. California is noted the world over for its magnificent fruits, and when people come here they expect to find the best of it on the tables of the hotels and restaurants, at such reasonable prices that they can enjoy all they want of it. The same criticism applies to our wines. California wines and fruits can be had in hotels of the East in better quality and at lower prices than in California hotels.

"Through the efforts of the California Promotion Committee many Eastern hotels advertise on their bills of fare 'California fruits' and 'California wines.' They know that these names will win atention. I understand that it costs something to serve fruit and have heard and appreciate the objections raised by hotel men, but I think that if the hotels would serve the best fruit, even at a slight loss, they would help to build up a better business. France is noted the world over for its good and cheap wines; Germany for its beer; Spain and Italy for their fruits. In none of these countries can they equal what California has to offer, and if the hotel men would take this matter up as a question of State pride, they would assist materially in building up California.

"You have a Hotel Men's Association here in San Francisco. If you will take that as the nucleus and form a Pacific Coast Hotel Men's Association, and when you have done so, stand together to exploit Pacific Coast products on your tables of such quality and at such prices as will commend them to the traveling public, you will accomplish one of the greatest benefits than can come to this coast. It has been the province of the California Promotion Committee to work toward such a commercial combination of all the interest of the Pacific Coast States, and if you gentlemen who care for the travelers will form such a combination, it will go far toward solving many of the problems that now confront us."

A man with his nose to the grind stone rarely keeps a cool head. A people in bondage are not wise.

DISC OR MOLD-BOARD.

Shall I buy a disc of a mold-board plow? is a question frequently asked by the farmer. The condition under which the plow is expected to operate must help answer it.

All farmers are acquainted with the mold-board plow and know how to operate it to the best advantage. The disc plow, on the other hand, is a newer invention and has not been used so extensively. It is harder to operate successfully and, for that reason, has not given the general satisfaction which should be obtained. The use for the disc plow, however, is gradually growing, and in a few years it will have almost as large a place, especially in the Western States, as the mold-board plow.

Under similar conditions, the disc plow is of lighter, draft but this difference is not so much as is often claimed by the manufacturers. Rolling friction makes it pull somewhat easier than sliding friction. Because of the rolling motion of the disc and its cutting effect, it is not so likely to clog as the mold-board plow. What the disc cannot cut it will roll over.

The disc is capable of plowing ground that has become too dry and hard for the mold-board plow. This is oftentimes of much value, as it is not necessary to wait for rain, and the seed can be planted at the proper time.

For humid sections and irrigated lands, the mold-board plow must be considered superior. Under favorable conditions for plowing where the soil is not too dry, the mold-board plow pulverizes and turns the soil more satisfactorily. It also handles sod to better advantage.

To do the same amount of work, the disc plow will require very little sharpening compared to the mold-board plow. This makes the running expense of a disc very much less than that of a mold-board.

The diameter of the disc should not be too large. A 24-inch disc for general use is to be preferred to one of larger diameter. The 24-inch disc will pulverize the soil more than a 28 or 30-inch one. The draft is a trifle more on the smaller one, but the difference is more than made up by the class of work it is able to do.

The disc should not cut too wide a furrow. It is far better to use two discs 24 inches in diameter, each one cutting 8 inches in width, than to use a 30-inch disc cutting 14 to 16 inches in width. Taking a narrow furrow tends to make the bottom less corrugated.

Plowing the same ground year after year with the disc does not keep it in so good a condition as if plowed with a mold-board plow.

The mold-board is generally considered best for humid and irrigated sections, and the disc plow for dry or semi-arid sections.—H. M. Bainer,

TECHNICAL SECONDARY EDUCATION.

During the last session of Congress Representative Charles R. Davis of the third congressional district of Minnesota presented to the lower House a bill known as H. R. 24,757. This measure is designed to promote throughout the States and Territories technical secondary education in agricultural, mechanical arts and home economics. In brief, it purposes to extend the provisions of the Morrill

t this session a new bill, H. R. 534, been introduced, and is being hed by its friends in Congress, urged by farmers the country

E BEST COAL IN CALIFORNIA.

he best coal on the Pacific Coast th of Washington is unique as to geologic age. Early in Tertiary e, ages after the carboniferous osits that formed the great coal s of the Eastern and Interior tes had been laid down, Stone yon, in the southeast corner of nterey county, California, was the of a marshy tract in which re gathered the materials that are hardened into an extensive bed bituminous coal. The bed is ut 15 feet thick and has been ced for several miles. It is mined two openings, but no shipments ve yet been made, owing to lack of lroad connections.

This coal bed was described by Ralph Arnold, geologist in the ited States Geological Survey's lletin No. 285, and a brief account its geology, by Mr. M. R. Camp- ll in charge of investigations, is w published in Bulletin No. 316 ontributions to economic geology, 06 Part 2, coal, liginite and at). Analyses of the coal by Mr. M. Stanton, are also included. e analyses show that it is a good -making coal, of excellent heat- g power. It contains little moist- e, but considerable sulphur. Sev- al hundred tons are now piled up the mine awaiting the construc- n of a railroad, and as the coal is rd and does not slake it should and transportation well.

The successful farmer of the date ee of the desert in California is al- ost as great a triumph as the suc- ful introduction in the past few ars of the Smyrna fig. Some pack- g and shipping of both soft and y dates may be done this year. ltimately, it is expected that the te will form an important addi- on to California's fruit product. So nfident of commercial success are ose who have been watching the te experiments, that considerable anting has been done by private owers.

The region selected for the experi- ent is the Coachella valley, west of alton and north of the Imperial val- y. There is no reason, experts say, hy it should not be covered with riving date plantations that will roduce the larger part of the fruit, ll of which is now imported.

A STRONG INSTITUTION.

The Security Savings Bank, which is the oldest and largest in Southern California, having a capital and surplus of $1,200,000, over 45,000 depositors and total resources exceeding $21,000,000, occupies the ground floor and basement of Security Building for its banking and safe deposit business. The main banking room on the ground floor has a frontage of 120 feet on Spring street side and of 126 feet on Fifth St., and its height from floor to ceiling is 25 feet clear. The arrangement of this room is designed to afford the maximum amount of service and convenience to the Bank's patrons, and to permit the business being carried on with the utmost economy and efficiency.

On the main floor are two large vaults, one for coin exclusively and one for books and documents. These vaults constitute a structure entirely separate from the main building. They have their own foundations, their own walls and their own ceiling. Being built to stand alone, and of such construction as to resist any conceivable attack or accident, these vaults would remain uninjured no matter what disaster might befall the main building or its surroundings. With burglar, fire and earthquake experiences in mind, the designers of these vaults aimed to produce a vault structure that would be proof against all three. The following brief description of the vaults will show how effectively this has been accomplished.

Safe Deposit Department.

In the large room directly under the banking room, is a most beautiful example of marble interior finish. The staircase and column designs are particular impressive as samples of skill and artistic conception in this line. In this room is located the Safe Deposit Department consisting of one vault containing 25,000 Safe Deposit Boxes, and another large vault to accommodate storage of trunks, silverware and, in fact, packages of any description. In construction the vault walls; floors and ceilings and doors are similar to that of the upstairs vaults.

Arranged around the room are twenty booths, all of them much larger than the ordinary booth in other Safe Deposit Vaults. Ten of them are 10 feet each in length by five feet in width, four of them are seven feet by 14 feet each There is also a large room 14 by 20 feet for use of directors, stockholders, etc., of any companies that may desire to use same for their meetings. There are also large consultation rooms, each 15 feet square, one being for men and one for women. The booths are all mahogny and equipped with a patent coupon-room door device which safeguards patrons against loss of papers accidentally left in a booth, as no booth can be used again until it has been opened and inspected by an attendant.

Access to the Safe Deposit Department is very convenient. Two of the main passenger elevators in the corridor of the Security Building descend to these Vaults each trip. There is also easy access by way of the large marble stairway that leads directly from the south door on Spring street. Entrance to this stairway can also be reached from the Banking Room.

THE UNIVERSITY FARM.

The following excerpts are taken from an address by Prof. E. J. Wickson at the State Farmers' Institute held at Davisville, recently:

We expect to realize for the University of California the greatest institution for agricultural research and instruction in the world.

No State or country is superior to California in natural adaptation to greatness in agricultural education, because no State presents agriculture in so many phases.

Agriculture is specially mentioned as one of the leading subjects to be taught at the State University, that the scientific knowledge essential to the success and prosperity of agriculture may be better known and more easily and quickly applied and with more immediate and more certain beneficial results . . . so that the University may send forth a tendril of thoughtful, helpful and affectionate regard to every acre of soil within the State.

Let there be no question, that it is the ambition of the administration of the University to make its facilities for agricultural research and instruction the greatest in the world. Whatever is fully true to California opportunities certainly has a start in that direction.

There is no State nor country with a population which needs such wide demonstration of agricultural science and such varied instruction in agricultural practice. Coming from all parts of the world, eager to adapt their agricultural experience to California conditions they are most appreciative of accurate local knowledge and anxious for the fullest possible enrichment of it. They are ready to provide for it most generously by State appropriation and by princely private donations. California is unique in the enthusiasm, appreciation and generosity of its agricultural constituency.

Nor is there any State in which agriculture is held in such high interest and respect by the non-agricultural population; and none in which the agriculturist holds such high rank socially and financially. What the California farmer thinks of his enterprise and investments and what his fellow-citizens think of them constitute agriculture a higher calling in this State than elsewhere. Upon such a foundation an institution which is true to its opportunities must be uniquely great and influential.

FARMERS' INSTITUTE.

Conductor Neff announces an important Institute to be held at Whittier for four days beginning March 17, 18, 19 and 20. It is to be the most important event in institute lines in Southern California this year. President Wheeler and Prof. Wickson are both billed to be present.

The first day will be devoted entirely to vegetables. The second day will be walnut day; the third day be given over to the inauguration ceremonies for the new pathological laboratory building and the fourth day will be entirely on citrus questions.

Eminent speakers will be on each day's program. A special feature of Wednesday evening will be a banquet to be tendered the attendants.

DRY FARMING.

When the arid districts of the country shall have become awake to the practical advantages of dry farming, the scarcity of rain will have little effect on the average production of those districts. Dry farming, as it is called, which is really intensive farming, and has been in vogue for half a century in sections of the old world, is merely continued cultivation, working the soil often to conserve moisture. In the United States this system has opened to cultivation more than 700,000,000 acres of land which was regarded as practically useless. Paying crops are raised on 4,500,000 acres of semi-arid land now under active cultivation and farmed, in large part, under what is known as the Campbell system. In California, Colorado and Arizona, it has been found that it is easier to produce certain crops such as corn, beans and vegetables, under this system, than by irrigation.

When the whole semi-arid region of this country is once put under the dry farming system we shall raise crops without fear of rain shortage, and we shall find, too, that the cereals and vegetables so produced are of a higher value as food products than they would be if produced under artificial water conditions. The quicker we adopt intensive farming the less worry we shall have concerning the annual rainfall.

GROWING SEEDS.

The time is at hand again when growers will be selecting seed for general crop purposes. Indeed, it may be a little late, even now, to offer advice on this subject for this season. However, the subject is always in order from a cultural standpoint and ought to be studied with signally more care if we are to derive the highest results from our standard crops.

In order to obtain the best seeds, we are clearly of the impression, and such authorities as the superintendents of our agricultural experiment stations support this declaration, that the grower should be a plant breeder, because of the necessity of carrying out the ideals of a breeder in increasing any special stock for seed. With many crops the breeding and seed growing operations are so closely yoked together that is is impossible to carry on one without the other. No one should attempt to undertake seed growing operations with either sweet or field corn unless he is conducting breeding operations at the same time and in connection with the growing of the seed for sale. With the small grains the practical farmer or seed grower on a large scale cannot without very much additional expense conduct any more than ordinary selection work in connection with his seed growing. Many growers, however, altogether overlook the selectio
simply grow seed of farm crops for seed pu
the same as they would grow them for or
market purposes. By this we do not mea
every one who undertakes the growing of
farm or garden seeds must go into the proc
artificially hybridizing different strains of
with which he is working, or that he mu
into all the details in connection with the
ing of plants that are taken up by the Agricu
Experiment Stations. He should, however,
a position to carry out the ideas of the b
who has brought the varieties or strains
growing into existence and should be able to
tain the vigor and productiveness of his see
well as quality by the very best methods of
production possible.

But we do mean to say that the g
should with all grain crops take the greates
sible pains to thoroughly grade and clea
seeds from which his crops are grown, have
stock from which he grows of high germin
and strong vitality, should keep all seeds
both by care to avoid mixture in handling a
conducting special selected increase plots
which to grow all his stock seed. All these t
can readily be done, but they require time
expense and many of the older growers
disregarded most of them.

Not long ago Mr. Coburn, the Agricultural
missioner of Kansas, wrote a stirring appe
this subject, pointing out the vital necessit
growers of alfalfa seed exercising utmost ca
the seed they put upon the market. He
that Kansas is overrun with dodder which
sown with alfalfa, and that irreparable dan
is being done the State by the almost crin
carelessness of seed growers. What is tru
Kansas is equally true of every other State
also, in great part, the cause of degenera
crop receipts.

In this connection we quote an authority
a South Dakota Station. "I would," he
"certainly advise every farmer or seed gr
as far as possible to test his own seed instea
relying upon others to do it for him, but the
ernment Stations offer opportunities to verif
results. The stating on the labels or package
seeds where and when they were grown, the
mination test, and when it was made, is a
departure in seed handling. It entails consi
ble more expense than the ordinary method,
it should be worth the additional cost."

We deem this advice well worth accepting,
it will prove of far-reaching value when the
vest comes.

gricultural Notes of the Pacific Coast

Northern California

umigation of orange trees is pro- ling at Colusa.

he dairy of Robert Ashburner is be sold at public sale March 14th.

lany potatoes of the lower Sacra- nto river are yet awaiting to be .

onoma and Mendocino counties e over 1100 bales of hops still in id.

oil Expert Mackie, of the depart- nt is making examinations near llows.

he Alameda Sugar Company has ured a large planting of beets near odland.

he Vacaville Reporter is discuss- the question "Can we get rid of Japanese."

ainfall at Yuba City to this time ounts to 12½ inches as against 18 hes last year.

anta Rosa sent a delegation to Cloverdale citrus fair on Wash- ton's birthday.

lany beautiful designs in citrus its were exhiibted at the recent verdale citrus fair.

he central irrigation district near lusa is involved in litigation over validity of its bonds.

veterinary surgeon at Napa has n arrested for practicing without necessary State license.

he cannery employees of the idley cannery have arranged for a picnic to be held on June 5th.

roville has had 4600 trees treated fumigation for the White Fly be- les the 7000 which were defoliated.

One of the largest water supply d power schmes ever planned in e West is materializing in Nevada unty.

A number of homeseekers are visit- g Willows, and it is expected the iry interests will be greatlly ad- nced this season.

The hop crop of the Sacramento lley for 1906 was 51,021 bales, and at for 1907 was 40,446 bales. Of is there is yet in storage 7752 bales.

Sutter county commissioners are gorously enforcing the nursery or- nance and making careful inspec- n of all trees imported into the unty.

One Gridley olive grower produced one acre of olive trees 1000 gallons prime olives, which, after being ade into pickles on his ranch, sold r $550.00.

Stock raisers of Eldorado county e very short of feed for their herds d some losses have been reported. uch feed has been shipped into acerville.

A horseradish grower at Colusa has und the raising of horseradish very ofitable. From a small patch of last year he marketed at the rate $400 per acre.

A recent issue of the Gridley Her- d produces a number of fine half nes of orange trees loaded with uit in proof of the worth of that ction as a citrus producer.

The president has just signed a oclamation creating additions to e Trinlty National Forest amount- g to 350,471 acres. The addition es mostly in Humboldt and Trinity unty.

Central California

It is estimated that 12,000 tons of raisins are yet in first hands.

The warehouses at Hollister and Tres Pinos are yet filled with hay awaiting shipment.

The Sempervirens Club, of San Jose, is taking active steps to save the big trees of the Big Basin Park.

It has been charged that some packing houses have seeded and packed some of the mildewed raisins.

An effort is being made at San Jose to secure the observance of March 7th as Arbor Day for the entire State.

Lindsay claims the ability to grow real bananas, but we presume does not claim she will ever forward very many cars of this fruit to market.

The recent rain in the San Joaquin valley, while not exactly needed, will give added assurance of a successful season.

The uncertainty regarding the sulphur ruling prevents absolutely any guesses on quotations on the coming dried fruit crop.

The Goshen, Tulare and Visalia horticultural districts marketed this season 6742 tons of dried prunes and 6822 tons of canned peaches.

Many potatoes in the fields about Stockton are still in the ground, and it is asserted that they will not all be dug until well into the month of March.

Under reduced prices the raisin output seems to be moving more freely. Fresno is now selling quite extensively and usually on the three-cent basis.

Some complaint has been made because the Sacramento committee is so long in getting the proceedings of the late National Irrigation Convention printed.

Entomologists of Central California have formed an association of county entomologists, Mr. Volck of Santa Cruz county, is president and Mr. Morris, of Santa Clara, is secretary.

In the citrus districts including Exeter, Lindsay, Lemon Cove, Naranjo and Portervile there was raised and shipped this season 2400 cars of oranges, with 175 cars of Valencias yet to go.

Well wishers of the State are more or less concerned over the reports that State Forester Lull may have authorized the destruction of some of the Redwood monarchs of the Big Basin park.

The Sonoma County Co-operative Association is making an effort to have all members sign an agreement to deliver all their eggs except those required for hatching, to be handled by the association.

Congressman Hayes writes the Grange of San Jose, that he is utterly unable to accomplish anything with Dr. Wiley on the sulphur resolution, but that Secretary Wilson gives assurance of doing everything to protect the fruit growers' interests.

The State Horticultural Commission is now concluding its White Fly work in the orchards of Oroville. The work has been in charge of Deputy Commissioner Carnes. It is asserted that the White Fly will be entirely eradicated by the thorough work.

Southern California

Oxnard rainfall amounts to about 14 inches.

Extensive alfalfa fields are being planted about Indio.

Corona's rainfall amounts to about 10 inches to this date.

Buaro, Orange county, is plowing much land for potatoes.

Extensive plantings of oranges will be made in Moreno valley.

Eight thousand acres have been planted to sugar beets at Oxnard.

A large number of eucalyptus have been planted near Redlands junction.

Escondido Packing Company is producing about 15 gallons of olive oil per day.

The peanut crop of Orange county for the last season is practically all disposed of.

The cabbage market opens at $10.00 with promise of better returns, is the report from Coachella valley.

Coachella valley has an artesian well which produces, under pumping, a supply of 100 miners' inches.

The San Joaquin ranch in Orange county will make an extensive planting of walnut trees this spring.

White laborers at Whittier are appealing to fruit shippers and pickers to give them labor in preference to the Japanese.

An Escondido paper is appealing for the growing of more bell peppers, as they have proven very profitable during the past season.

Orange county was visited by a freak cyclone last week which upset some light buildings and people's calculations on California weather.

The Santa Ana Walnut Growers' Association received for 1907, $152,567. The price reecived by the grower was $13.55 per hundred pounds.

Imperial valley farmers are demanding that part of the program of the Fruit Growers' Convention to be held at Riverside be given to desert fruit culture.

Recent decisions of the Department of the Interior have been satisfactory to the land claimants of the Imperial valley, and honest settlers feel that they will be protected.

The greatest shipment of oranges in one week out of the city of Redlands was passed recently, when a total of 299 cars and 230 boxes were shipped within the seven days.

Imperial valley has been greatly inconvenienced by a recent injunction stopping the wasting of water in the Salton Sea. This has deprived the towns of electric power and light.

Coachella and Imperial valleys are looking with much interest at a new paper making plant introduced from Africa. It is the alfa grass, the seeds of which are now being disto desert farmers.

The mountains of Southern California are now covered with the "beautiful," and the canyons are running full of water. The supply of irrigating water for next season is practically assured.

The cool weather following the recent storm was sufficient to do some injury in the lower vegetable sections, especially to some of the very early tomatoes. The extent of the injury, however, is slight.

The Coast

The new Swift packing plant at Portland will cost $3,500,000.

Walla Walla, Washington, is making war on the English sparrows.

A farmers' school is now a permanent institution of Sevier county, Utah.

The city of Denver claims the largest flock of pea-fed lambs ever marketed.

Arizona farmers are now turning their attention to the production of early cantaloupes.

A steamer from Portland, Oregon, recentlly cleared for Port Said with 217,445 bushels of wheat.

A stock grower at Pendleton, Oregon, recentlly paid $6000 for 41 head of Delaine and Shropshire rams.

The Spokesman Review of Spokane is offering a series of prizes for the best model irrigated tracts.

Wheat touched the lowest point of the season at Seattle, Washington, recentlly when it was quoted at 82½ cents.

One clearing of 1000 acres of forest trees along the Columbia river will be planted to winter apples this coming spring.

Prosser, Washington, reports that the abundant rains of this spring will give immense wheat crops in that section.

The Oregon State Board of Horticulture has many calls upon it for the recent biennial report, which is a very valuable one.

Stock growers of the Northwest are hoping for the establishing of a packing house of the Swift Company in the early future.

British Columbia does not permit the export of logs cut on provincial lands. They must be sawed by mills within the province.

Freewater, Oregon, captured the Falkenburg cup offered at the Washington State Fruit Growers' Association for best display of apples.

Produce Exchange of Portland, Oregon, is making a fight against farmers driving in and selling their own produce to buyers of that city.

One of the largest and most successful meetings in the history of the Oregon Pure Bred Live Stock Association was held recently in Portland.

The lieutenant-governor of British Columbia has created a great reserve in public lands by which all timber lands are held in control of the government.

One hundred large fruit growers at Cashmere, Washington, have organized a horticultural association allied with the Cheelan County Horticultural Association.

Alfalfa hay is selling in Tacoma, Washington, at $15 and $16 and wheat hay at $18 and $19 per ton. In the same market some Timothy is offered at $27 and $29.

Farmers' Union at Colfax, Washington, are making war on weed pests, and are asking for a rigid enforcement of the law, especially against Canadian thistle and "Jim Hill" mustard.

A large syndicate is purchasing a 160,000 acres of timber land in British Columbia. The land is situated on the north end of Vancouver and on a number of Queen Charlotte Islands.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Ya

We solicit short articles of a practical nature from the fancier and ut breeder, giving their experiences with poultry. All inquiries pertaining to f management, disease and its prevention will be answered through these colur

PROPER FOOD FOR YOUNG PULLETS.

THE proper or best method of feeding our early pullets is a subject that has caused no little study. Most everyone has their own method of feeding. Some contend that a whole grain ration is best; others that a dry mash fed in feeders is the proper thing and still others that only wet mash should be fed if we want to get the best results.

Dry mash fed in hoppers is very popular just at present and those who use either method of feeding will be interested in an experiment made at the Cornell University Experiment Station, covering a period of 364 days.

The experiment was made with 80 single comb White Leghorn pullets that were five months old when they were selected and put into pens for the test. The pullets were placed in four pens as nearly evenly divided as was possible, so far as size and vigor was concerned, and their surroundings were practically alike.

Method of Feeding.

Two methods were used in feeding, which they term as forced and retarded. Pen number one, forced, was fed grain mixture morning and night in litter, and a wet mash at noon. Pen two, forced, was fed a grain mixture morning and night and a dry mash in hoppers open at all times.

Pen three, retarded, received grain morning, noon and night in litter, and beef scraps once a day in a trough. Pen two, retarded, was fed grain mixture and beef scrap in hoppers open at all times.

The pullets in all four pens had grit, oyster shell and water always before them; were also given mangel beets and green cut bone at intervals.

Accurate Records.

The birds were trap-nested the entire time and accurate records were kept as to number of eggs, weight of eggs, weight of hens, amount of grain consumed, effect of different food on molt and period of molt.

The average quantity of food consumed per hen in the retarded pens was about two pounds more than that eaten by the hens in the forced pens, at a cost of three cents more per hen. The hens having whole grain ate 38 per cent more grit than those having part ground grain and although laying less eggs consumed 27.9 per cent more shell.

From the beginning of the experiment in July until February, the cost per dozen eggs was decidedly less in the forced pens. After that time the cost was much less in both cases and the difference between the forced and retarded was small. For the whole year the average cost per dozen was 20 per cent less in the forced than in the retarded pens.

The dry-mash-grain-fed flock made the best profit, $1.45 per hen, and the wet-mash and grain-fed flock came next with $1.34 per hen. This gives an excess of profit of eleven cents per hen in favor of the dry-mash-grain-fed method of feeding.

Fertility.

Of the eggs which were incubated, 371 were from the forced pens and 383 were from the retarded pen eggs from each pen were pla several machines, where con were as nearly alike as possibl result was that the eggs fror forced pens gave 11.5 per cent chicks than from the retarded The report of the entire cont summed up by those conductin experiment as follows:

Summary.

The findings drawn from the of this experiment are as fo but they should in no case be a ed as final until verified by rep experiments with vastly more f

1. Forced pullets made a profit than retarded pullets.

2. Forced pullets ate less foo hen at less cost per hen than ret pullets.

3. Forced pullets produced eggs of a larger size, at less cos dozen than retarded pullets.

4. Forced pullets produced eggs during early winter than re ed pullets.

5. Forced pullets gave hatching results of eggs than re ed pullets.

6. Forced pullets made a gr percentage of gain in weight tha tarded pullets.

7. Forced pullets showed broodiness than retarded pullets.

8. Forced pullets had less m ity than retarded pullets.

9. Forced pullets showed vigor than retarded pullets.

10. Forced pullets showed the mature molt earlier than ret pullets.

11. Retarded pullets gave fertility of eggs than forced pul

12. Hopper-fed dry mash gave ter results in gain of weight pr tion of eggs, gain in weight of hatching power of eggs, days lo molting, mortality, health and per hen, than wet mash.

13. Wet-mash and grain-fed lets consumed slightly less foo less cost, and produced eggs at sl ly less cost per dozen than dry-r and grain-fed pullets.

14. Wet-mash and grain-fed lets produced slightly larger egg slightly better fertility, and sh less broodiness than dry-mash grain-fed pullets.

15. Dry-mash and grain-fed p laid eggs of good size at an e period than wet-mash and grai pullets.

16. Hopper-fed pullets ate than hand-fed pullets.

17. Pullets having whole grain more grit and shell than those ing a proportion of ground grain

18. Pullets fed on grain were n inclined to develop bad habits t those having a mash.

19. Earliest producers did not as many eggs in early winter.

20. Early layers gained as rapi in weight as those beginning late t lay.

21. Prolificacy made but slight ference in weight of hen and we of egg.

22. The most prolific pullets not always lay earliest.

23. Pullets did not, as a rule, while molting.

We have for a number of y been a believer in the dry mash

hopper-method of feeding, and are to-day feeding our hens a mash in hoppers and giving a mixed grain ration at night only. We believe it is better to feed the grain at night than in the morning.

If we should accept the result of this experiment as final, we would see that the dry mash is the best method of feeding.

AROUND THE YARDS.

Soft shelled eggs are generally caused by hens being too fat.

* * *

Never market a dirty egg; one soiled egg will give the whole lot a bad appearance.

* * *

Milk is excellent for laying hens, as it contains constituents of the white of eggs.

* * *

Old hens lay larger eggs than pullets and their eggs produce stronger and more vigorous chicks.

* * *

In marketing your eggs, if you have a mixed lot, sort out the white-shelled ones from the brown-shelled ones.

* * *

Los Angeles consumes daily 900 cases or 27,000 dozen eggs. Here is an item for those who contemplate going into the poultry business. Figuring on a basis of 25 cents per dozen would amount to $6750. In figuring the amount of eggs consumed, only those that were sold were figured; when we add to this the ones that are used by those keeping fowls, the amount will be considerable larger.

We believe there is a good field in California for market poultry and eggs, as thousands of dollars worth of poultry and eggs are shipped into this State annually, and the day is a long way off when there will be an over production of either poultry or eggs.

SYMPTOMS OF ROUP AND TREATMENT.

It is not always possible to tell catarrhs from roup. Generally, we say that roup has a smell of its own. A few roupy birds confined in a fairly tight house give off an odor that is plainly evident in the early morning. Besides this, there may be watery eyes, running at nostrils, swelled head and discharge from mouth. The bird rapidly looses flesh, color of comb and lobes is less red, and thirst is somewhat prominent. Roup is hard to cure. How do we know this is so? By the large number of "cures" offered for this disease. There is hardlly any one of the "roup cures" that has not its host of friends.

I do not know that anything is better than arsenite of atinomy and kerosene. The dose of the arsenite is very small, one three-hundredths of a grain four times a day, being dose enough. One teaspoonful of kerosene oil to sixteen quarts of drinking water will help cure and prevent new cases. The kerosene oil works by destroying the germ life of the disease as it comes in contact with them. Every drink of water leaves a little oil in nostril and mouth and the oil also acts on any discharge that may dip into the water dish. I need not add that houses should be kept clean, well aired and dry. Ill birds should be kept well apart from the others and new cases quarantined as they appear.

Most important of all is the keeping out of breeding pens any bird that has ever been seriouslly ill with roup. You cannot afford to use a "cured" case of roup if you would maintain health in your flock.—Dr. Sanborn.

Feed the Chicks and Kill the Gophers

West Coast Chick Feed

A full, rightly balanced ration for the little ones, to be fed dry. All pure feed, no filler, no waste. The biggest seller because the best made. Keeps them growing and healthy. For sale by many dealers; if not by yours send direct to us.

Bille's Gopher Poison

is most attractive to gophers, squirrels, etc., but sure death. Endorsed by Agricultural Colleges and Experiment Stations. Has had the greatest success for years in the Middle West, and also here in California last season. Circular with many testimonials and Affidavit of 201 killed in one day. If your dealer hasn't it, send $2.50 for two bottles, (not less than two) express prepaid by us. Money refunded if not as represented—so printed on the bottle.

WOMAN IN THE POULTRY YARD

What women have done, other women may do. Therefore, I have thought it might be of interest and practical helpfulness to give in this department a sketch of what has been done by certain women for the benefit of the feminine readers of S. P. J.

Very uncommon, indeed, is the success that has been attained by Mrs. B. C. Johnson of Maxwell, Iowa. One day last summer she invited her neighbors to come and see the 2000 chicks she would show them, newly hatched. It is said that some people came 200 miles to see the exhibition. She had a crowd, and all expectant. She told them she had made a miscount. Instead of 2000, she had 2330 to show them. It is safe to say very few women, or men either, for that matter, could make such a showing. The chicks hatched were mostly Brown Leghorns. The year before she hatched in a single day 1087, and by general consent Mrs. Johnson was given the name of "Poultry Queen of Iowa."

This woman's success gives weight to her ideas regarding the hatching business. She considers a temperature of 104 degrees very close to the danger line. She starts the head at 102 for the first week, keeping it at 103 the second and third week, never allowing it to go long at 104, and never above it. She claims that too high a temperature causes chicks to die in the shell. She also believes that chicks should be removed from the incubator as soon as they are dry. She contends they cannot bear the high temperature without injury. With due respect to Mrs. Johnson, I wish to suggest that this matter depends upon the incubator. Some machines have so cold a nursery that the wee babies are chilled in it; others may be too hot. Where the nursery temperature is about 90 degrees, they are better off left in the machine until time to put them into the brooder. By testing the heat in the bottom of the nursery a few days before hatching begins, it is an easy matter to decide this question.

Neither does Mrs. Johnson believe the brooder heat should be as high as is usually recommended. She considers 86 degrees high enough to start with. She always cools the eggs before turning, which will be a new idea to many. She introduces moisture the last of the hatch. This enables the little fellows to pip the shell more easily.

So much for one eminently successful woman. There are many of them, but just now we want to introduce you to Mrs. Emma J. Hertzog of Nebraska. She began in a small way, letting her business grow naturally, until she had mastered details, and fitted herself for later successes.

Seven years ago she purchased her first setting of Single Comb Buff Orpington eggs, paying $5 for fifteen. This was quite a venture, as it was her first purchase of pure bred stock. As a result she now has a flock of something over one hundred and fifty chickens of the finest quality, and which draw many poultry enthusiasts as visitors. She is such an enthusiast herself that it is contagious.

Mrs. Hertzog has been very successful in the show room. In 1907, at the big State Poultry show, she won the silver loving cup, worth $20, for the best display of fresh eggs. This

DO CHICKENS PAY?

iven proper care, comfortable
rters, regular feeding of the right
d, nothing on the farm will pay so
l, considering money and labor in-
ted. Experience is more impor-
t than capital. Here are a few
nters: Give the flock plenty of
e, fresh water at all times. See
t they never lack grit in the shape
sharp gravel or one of the pre-
ed grits. Wood ashes and tobacco
t in the dust box will help drive
ay lice. If you have no trees in
yard, plant sunflowers, preferably
the Russian variety. The shade
welcome, and the seeds have food
ue besides. In raising broilers
main thing is to get the chicks
weigh one and a half to two
nds, as your market demands. I
l that there is nothing better for
tening old fowls than dry, hard
n.—Farmer Boy.

SETTING THE INCCUBATOR.

The time is coming, and all too soon, when we should begin thinking about setting our incubators. Those who have them can set them at the time they desire, providing they have been fortunate enough to get eggs enough, and if they have not it will pay them and pay them well, too, to buy eggs from some one who is getting eggs. It has been my experience that sitting eggs early, which were laid in winter, by hens that lay good, are sure to bring us winter layers, while eggs set from spring and summer layers bring us only a very small number of winter layers. It pays us to set winter-laid eggs and thus improve our stock by making them come nearer the 200-egg mark. I have made this a practice for the past five years and now I cannot find a hen that is not paying her way, and making a good profit besides, in my flocks. I usually set my incubator the first time the first week in February so it will hatch about the first of March.

The first thing one should see to is that you have good coal oil, as I find this has a great deal to do with keeping up even heat. I always use one company's oil as I find it gives better satisfaction than any of the others I have tried. An oil that smokes soon forms soot which makes it very difficult to keep up heat with sooty flues and the soot is liable to get afire and cause much trouble.

I start my machine early in the morning by filling the tank with hot water, then fill the lamp, cut the wick straight across, being careful not to leave any corners to smoke. (This is the only time the wick is trimmed; after this I scrape off the char with a match.) I place a piece of paper in the egg tray on which I place the thermometer. I keep the damper down until the heat registers 100 degrees, then I set the regulator so the damper just begins to raise, and then I fill the tray with eggs, all it will hold without crowding. It takes from ten to fifteen hours for the cold eggs to warm up to 100 degrees. I keep them at 102 degrees the first week, the second at from 102 degrees to 103 degrees, and the third from 103 degrees to 104 degrees. This temperature I find brings good, strong chicks. I begin turning the eggs on the third day and turn from two to three times a day; the oftener they are turned the better, if they are warm enough. I also sprinkle eggs once each week and twice the last week just about as much as I dampen clothes for ironing, as this has a tendency to make the shells brittle so the chicks can easily get out. I take the chicks from the incubator as soon as they get dry and spry. This gives the remaning ones a better chance.

Be very careful not to let your machine run dry or the lamp go out. This is not written for the benefit of experienced poultrymen and women, but for the benefit of amateurs.—Kansas Farmer.

Hesperia Land and Water Company has secured control of 35,000 acres of pasture land through which the Mojave River flows, which with 500,000 acres in surrounding government land will be used for pasture purposes. The firm has 6000 head of cattle contracted for.

Barred Plymouth Rocks
Ocean Blue Strain
D. T. Wieland, Moneta, Originator
This strain has been bred in line by me for 19 years and never defeated in the show room. For 16 years our pullets have never lost first prize. At the big Chutes' show 1908, we won first and second pullet in a class of thirty, nothing else shown. Eggs $2.00, $3.00 and $5.00 per 15; incubator lots at $8.00 per 100. Eggs now testing fine. We have purchased the best son of the first Chicago pullet, 1907, to head one of our pens. A first prize cockerel heads our cockerel breeding pen. Other pens the same breeding and good ones.
Take short line car at 2nd and Spring Sts., via Gardena; get off at Illinois at Moneta. Right on Ranch.

Starbuck's Barred Plymouth Rocks
We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are layingfine. We have divided into pens according to the way they are showing up in six months laying. $2.50 for 13 eggs from first pen. $1.00 from 2nd. until they have time to make longer records. (Except from our one best, not for sale. We claim the world's Barred Rock, 6 months laying record for this one.) Do you wish to hear about our prize winning Buff Orpingtons and Silver Wyandottes? We have something to crow about. No Sunday sales or visitors. Wm. Starbuck & Son. Fullerton

Live Stock and Dairy

THE COW'S HEALTH.

SELFISHLLY we went for years along our way leaving the dairy in the hands of the ignorant foreigner, while the man of more intelligence devoted himself to fruit and grain growing. The contempt that the dairyman was held in has only begun to pass away. I remember hearing my dairy spoken of with approval and the remark added in an apologetic tone, "You know she does not have to have a dairy, but does it because she likes cows." Of course I like cows, horses, dogs, cats and babies, in different degrees, to be sure, yet right here, please, dismiss the thought if you have it, that I worked up a herd of cows and ran a creamery for fun. I can have fun in less laborious ways than that. There is an interest in cow breeding along scientific lines, the studying of the transmission of acquired traits and the slow bringing of animal life to the type first conceived mentally as desirable, that possesses a fascination only equalled by "the joy of putting salt on the tail of an idea."

Health.

Comfort, warmth and good food with abundance of fresh water are necessary for the health of the domestic animals, fully as necessary as for the human family. The health of the cow producing milk and butter has much to do with the health of the consumer. This is a deeper question than the mere washing of cows' udders and keeping the manure out of the milk. By beginning at these visible things, we can hope to, in time, reach the inner conscience of the dairyman. Cows that are not thrifty looking should go out of a herd; they may not be tubercular, but they are not vigorous. I have never hesitated to make beef out of weak animals; no doubt, have sacrificed butter producers. I know of one cow that was allowed to grow up that was somewhat weakly that has made a good record. Her sons, however, are now heading herds; one of these succumbed the other day to tuberculin test. The dam could not pass on a constitution for she did not possess one. I sold this cow after she dropped her first calf, retaining the heifer from her. The heifer grew up, dropped one or two calves, and died early in life. Never reacted when tested but lacked vigor.

Now, there is another point here as well; I am sorry to say that the original cow was awarded first prize for dairy form at more than one fair. Should not vigor be considered by the judges rather than the fineness of hair or other minor points? Yet, the breeder of Holsteins well knows that his most vigorous cows will not receive as high a place in the show ring as the cow he finds of a less desirable type for his own dairy.

Exercise.

Show ring cows suffer by pampering and close stalls. The ordinary family cow suffers often from want of freedom; she is either kept in a small enclosure or else tied on a stake line. When this is necessary, why not take the cow for a short walk each morning before staking her out? This is for her health and vigor, not for conserving all the food consumed to make into butter fat with the least loss possible. Men vainly imagined that cows could be made into a mere machine for producing a given amount of fat from a given amount of feed. So many pounds of food—such a per cent of protein and carbohydrates—put into the cow's mouth—draw the milk and make the butter so many pounds less a certain per cent for maintenance. This is the way the Germans figured it out.

Jerseys.

The easy creaming of the Jersey milk makes them the queens of the dairy under hand skimming process of butter making. The large globule of fat rise quickly and is a desired thing in a family cow. One noted Jersey importer visited the ranch some years ago. He told me of the feeling the breeders had toward the American breeders of Jersey was that of sorrow. They deplored the loss of health and vigor that they feared would follow the practice of early breeding of the heifers. I am speaking of this, as I have been to the early breeding has been advanced as being greatly in favor of Jersey cattle. The breeding of calves by turning in a young male with them when they are five months old and having them all in calf before ten months old! This is wrong, doubly wrong in California, where the calves are skim milk fed and turned out to pick their living on scanty hill pasture. A skillful feeder might force these youngsters along and keep feeding them, and not do too much mischief. The beautiful Jersey heifers! It is a pity to marr their lives and stunt their growth. The star-eyed brown and gray beauties are too fawn-like to be made into wrecks early in life by these unprincipled men that trade in their lives.

Holsteins.

These cattle are often bred too early; we used to breed at fifteen months, but lately have been putting back the age to twenty to twenty-four months. It has paid us in this way to do so. The heifers come in, giving 50 to 60 pounds of milk instead of half the amount. It is cheap to pasture a heifer, only $5.00 a year; as soon as they are cows the rate doubles, not according to size, but according to age. The heifer is mature then to give a strong, valuable calf that will in turn make a good cow. The first calf from these heifers are as good as any others that are dropped. The largest calf ever born on the ranch from the dairy cows weighed 123 pounds at birth and was from a heifer that was bred at 23 months old.

The adolescence of the future cow needs to be guarded as a formative period. The unbred heifers will look slightly steer-like after fourteen months old, but do not worry over that; let them have the vigor, that this indicates, to build up into milk later on. The fact is, that type in the two sexes should not show until they become fully matured.

The same is true of the human being. The Greeks in sculpturing their goddesses used the boy of fifteen for the models until this fact was brougth out, the heavy waists of the goddesses was quoted at mature women as the national figure. Every slim waisted woman was regarded as having laced by the medical profession.

You can't harden a horse by making him endure hardship. The well bred, well kept horse is best.

HOGS AND ALFALFA.

me farmers put not more than pigs on an acre of alfalfa and cut the crop for hay when nec- ry. This gives the hogs a run on h, tender forage the season ugh. These shoats when put on diet, whether with alfalfa or make rapid gains and will make er use of corn than hogs grown birth on corn ration. Every- y knows that hogs grown on al- have much greater resisting er to cholera than those grown corn.

There is nothing, aside from the of human kindness, so neces- to the comfort of any family as milk of a good cow. It is like poured upon the waters of life; s a perfect food for the baby; it n excellent beverage for the dren; it furnishes cream for the e, butter for the bread, and se for the lunch. It shortens pie crust and raises the johnny- ; even the cat and the dog cry it. With the farmer it goes still her. It raises the calf, it feeds pig, it pleases the colt, and it de- its the chickens. Yes, and if he only give her a fair chance, the will clothe the children, buy nforts for the wife, pay the taxes help lift the mortgage."

A DAIRY YARD SCENE.

reeding sows and young pigs ould be fed plentifully with wheat, n and other muscle-forming and e-growing foods.

n nearly all cases in summer the results can be had with breed- sows by turning them into a field ere there is plenty of pasturage.

t is much better to have the pigs ittle hungry and come to their with a sharp appetite than to e them lazy and indifferent about A pig that is always full will ely take the exercise it should.

o have a boar in best condition should have a mixed feed com- ed of three parts of bran, two of dlings and one of oil meal. If in clover pasture he should have les or clover hay.

n old sow that has shown herself ood mother should be preferred to that is younger. The practice of ng young is sure to end in degen- cy of stock sooner or later if fol- ed up.

o far as possible with pigs, the e should always be a thorough- d, and it is not a good plan to use ross-bred male even if of good lity, and especially if uniformity esired among the offspring.

ismanagement in feeding, breed- and caring for stock tends to dis- e constitutional vigor and the hog suffers more in this respect from poor treatment than perhaps any other class of stock from the fact that there is a greater tax on his system.

As a general rule, a good appetite is a good indication of health, and a hog that will eat heartily three times a day can generally be looked upon as in good health, and with good management can be made ready to market at the proper time. It is much easier to keep hogs in good health than to cure them of disease.

In the successful management of hogs there is no more important point than to keep them on full feed, to keep them eating to their full digestive capacity. Without this it is impossible to raise hogs so that they can be marketed at from seven to nine months of age, and unless this can be done there will not be the best nor a proper profit in the business.

SHEEP NOTES.

The ewes should be two years old before being bred.

Regular feeding makes a steady growth and good wool, as well as good lambs.

The best wool and the best mutton are obtained from the sheep that has been kept growing all its life.

If the best profit is realized, not only the wool, but the mutton and the lamb must contribute their part.

The weight of the fleece and the quality of the mutton has more to do with profit in sheep keeping than the tariff.

A fattening animal of any sort should never have more food placed before it than it will eat up with avidity.

Sheep restore to the soil a larger proportion of the elements than they take from it in grazing than do any other stock.

Scab, foot rot, liver trouble and catarrh are all diseases that are induced by lack of thrift. Lack of thrift is induced by lack of care and lack of feed.

Sheep husbandry is something like fruit growing. It is about the poorest kind of an occupation for a careless man.

Sheep are the only animals that do not exhaust the land upon which they feed, but permanently improve it.

The only way to keep a flock up to a high standard, to keep the standard raising higher all the time, is to cull and cull.

In growing the finer quality of wool, the grass, hay, grain or water will in a measure affect the quality.

Sheep, through the peculiar nutri-

West Coast Cresol Dip

Strongest and most effective Germ Destroyer, Insecticide and disinfectant. Made of Coal Tar Creosote Oil. Great caution must be exercised in using Carbolic Dips and those that contain Petroleum oils. Reports in 1905 from Wyoming show that many sheep died on account of dipping in petroleum. Sulphur-Lime dips impair the quality of wool on sheep, and sometimes blind them. Tobacco dips very often sicken sheep. And none of these dips can compare in effectiveness with Cresol Dips. These, while being most effective, are perfectly harmless. Wool is improved by their use, as it not only cleanses the wool but leaves no stain and gives it a soft texture.

But Cresol Dips differ very much. A Coal Tar Dip depends for its activity almost entirely upon the Cresylic Acid it contains. West Coast Dip is guaranteed to be made from Coal Tar Creosote Oil containing 25 per cent Cresylic Acid. Most dips sold in the United States are made from domestic creosote oils, which run about one-half the strength of imported oil. Permission was given by the U. S. Dept. of Agriculture to use our Dip for the treatment of sheep scab in the proportion of one part Dip to 67 parts water. This is the highest dilution we have ever heard of being permitted by the Department. When thus diluted it costs but a trifle.

For sale by many dealers. If yours does not keep it, send direct to us for trial offer, "special price and freight prepaid."

What The New 1908
De Laval Cream Separators
Are Doing

Reports are arriving in every mail from Maine to California and Canada to Florida, telling of how the New Improved De Laval Cream Separators are sweeping all would-be competition aside. Cow owners and separator users everywhere cannot say enough in praise of the new De Laval. Even competitors are admitting its vastly increased superiority and marvelling at its many conveniences, perfect skimming qualities, ease of running, great simplicity, durability and beauty of design. The new De Laval is ten years in advance of any other separator made today. Nothing like it has ever been produced before and to have done so now is only possible after three years of constant experimenting by the world's best engineers and mechanical experts backed up by our thirty years of experience in the manufacture and sale of nearly a million separators. Improvements have been made in every feature and several brand new styles and capacities introduced. There is a machine for every size dairy from the smallest to the largest and at a price that will fit every pocket, while you may buy for cash or on terms so liberal that the machine will actually pay for itself.

If you own one or more cows you can make no more profitable investment than to purchase a De Laval machine at once. It will save its cost in less than a year and after a week's use you will prize it as the most valuable implement on your farm. Ask for a free demonstration at your own home and send for our handsome new catalogue illustrating and describing De Laval machines in detail. Write today.

Office of the Secretary,
Room 729 P. E. Building.
Los Angeles, Cal., Aug. 10, 1907.

Mr. F. J. Kimball, Agent,
Harris Air Pump Co.,
Los Angeles, Cal.

Dear Sir:

The test made on our well No. 6 with the Harris Pump was very satisfactory, showing a substantial increase in amount of water delivered over the old system.

Yours truly, G. C. Ward, Asst-Gen. Manager.

Write for general information and records of tests, designs and specifications for all kinds of power plants. Speciality of irrigation systems.

tiousness of their manure and the facility with which it is distributed, are found to be the most economical in renewing the productiveness of the land.

A fairly well bred flock of ewes bred for a few years to none but first class rams will in a short time give as fine a flock as one could desire for all practical purposes.

Good wool as well as good mutton depends largely upon the quality of the food. Succulent food makes the best wool, the cleanest, brightest, softest and strongest.

As a rule, the wool of young sheep is stronger and has more elasticity than that of aged ones, which, for want of youth, has less strength and fibrous body.

If a cull ewe is admitted to the flock the chances are that she will rear a cull, and one worse than herself (for that is the tendency of nature.) Then there will be two culls instead of one.

It is claimed that by using rams in the prime of life with old ewes a larger proportion of ram lambs will be produced, and by mating ewes in the prime and vigor of life with young ram lambs before they are mature a larger proportion of ewe lambs will be secured.

In order to keep sheep for wool, it is essential to have young, uniformly well-wooled sheep, and they must be constantly kept in a healthful, thrifty condition to yield sound fleeces.

FEED THE HORSE REGULARLY.

The horse is next to a human in spirit, physical structure and desire for regularity. To get the best results from him he must be treated much as a human being should be. He should have regular care, be curried thoroughly every morning, for at least half an hour; for currying is his bath. It cleans the skin, opens the pores of the body and aids digestion.

Whatever hour he is fed, morning, noon and night, should be strictly adhered to. About the same quantity at each meal should be given. If the horse is a working animal, he will require more hay and grain than a driving horse that only occasionally works. His ration should be changed, too, in order to keep his appetite keen. Do not feed barley hay every meal through the year, but interchange with oat hay and occasionally, say once or twice a week, give a little alfalfa, not a full feed of course, but a small bunch with the oat hay or barley. Alfalfa has much the same effect on a horse that spinach or greens have on a person, it is cooling, relieves the kidneys, throwing off certain salts and chemicals, and brightens the hair, this of itself shows its healthy action. Always observe the same rule in watering. Water half an hour after or before meals, but preservo some rule about it.

Probably more mistakes are made in graining than in anything else. We generally feed too much grain to driving horses. Grain is necessary, of course, but not in as great quantities as generally given. Enough hay and grain should be fed to keep a horse in good flesh and spirits, but excessive rations of barley or corn will burden the stomach, produce indigestion and breaking out of the skin. Vary the grain diet, feed barley a week then oats, then ground corn if the horse is a field animal, and always g

THE UNDERFLOW.

A GREAT deal has been said about the "underflow," and the term is so subject to miscon- ion that I dislike to use it. It is ɟ to convey the idea of a great progressive movement of water, ıaps from the mountains, extend- across a great extent of country. would suppose that there is an ·nsive undeground stream flowing he pace of a river. These con- ions are all wrong. There may a movement of water, but it is no erent from the underground ement occuring everywhere, and a greater extent in the East, for e in the more humid climate e is more water in excess of ooration to contribute to the ınd water. If the great slowness the movement of this under- ınd water is realized, then the n is not so objectionable. Water flow through all soils, but slow- ıs the soil is fine. In a moderate the speed may be but a few

ıes per day; in sand it is not apt exceed 10 feet a day, or consid- ɔly less than a mile a year. The d of the Arkansas and the Platte eys rarely furnishes a velocity h greater than this. If the surface he underground water is traced, it be found to be of much the same tour as the surface—low where ground descends, and the higher he hills. This is because the ınd water is nearly all of local in. The ground water slopes as surface does. Even in the sandy ams which seem to lose their it is found that the level of the und water is higher than the er of the stream, unless at floods. the case of hundreds of miles of els run across and in the vicinity the Arkansas river, in connection h the defense of the Kansas-Colo- suit, this was invariably found be the case, and so in other eams. There is an underflow in sense that there may be a flow lerground, and that it goes down . But that there is a general un- ground movement over large as and from great distances is a take. The people in Eastern Col- do and in Kansas often delude mselves with the notion that their od water comes from the moun- ns. Usually the source is near by.

Vahiawa, Hawaiian Islands, will ɔduce the enormous crop of 13,000 ıs of pineapples this season. This l comprise 1500 carloads. One of principal producers in that sec- n is Mr. W. B. Thomas, formerly of the owners of the Cultivator.

Farmers' Institute of Hawaii was ently held in Honolulu.

RIVER IMPROVEMENT.

President Rufus P. Jennings, of the River Improvement and Drainage Association of California, has called a meeting of the association for November 11, next, at California Building, Union Square, San Francisco, for the purpose of having those interested in river improvement hold conference with the California Congressional Delegation just prior to its departure for Washington. At this meeting many matters will come up for discussion, and it is expected that there will be a large gathering. Since the Superior Court of Sacramento county declared the Sacramento Drainage Act constitutional, the work of river improvement has been pushed, and it is expected that much benefit will come of this meeting.

One of the most important pieces of work that is contemplated by the Sacramento Drainage Commission is what is known as Horseshoe Bend Cut-off, between Three-mile slough and Toland's landing. The question of feasibility in this improvement is wholly one of cost. Among the advantages that would result may be mentioned: The length of this reach, which is 23,000 feet, would be shortened by 6640 feet, and the flood plane at the head of the cut would be permanently lowered by one foot. The cut-off would materially facilitate the passage of the floods through this part of the river. The lowering of the flood plane would add considerably to the security of the levees in the Cache slough and Grand Island regions and below. According to the estimates of the commission 9,700,000 cubic yards would have to be removed, and to the cost of this work would have to be added that of about 500 acres for right of way. The net cost of making the cut would be about $1,000,000.

This will be the first step in a large, systematic and comprehensive plan of river improvement, and at the meeting in November other plans will be disgcussed by United States engineers and others who are interested in the matter. Co-operation on the part of all interested parties and organizations is essential to success, and as the River and Improvement and Drainage Association has matters well in hand it would be well for all organizations to assist it in its efforts to bring about a betterment of conditions. The association is securing data relating to tonnage and possibilities of future tonnage, through Prentiss Maslin, whose services it has secured, and this data will be available for presentation to the National Rivers and Harbors Congress at its meeting in Washington next December. It will also be furnished to Colonel Biddle, in charge of the United States Engineer Corps in California, who says that his work is much hampered through lack of such data. Through him it will go to the War Department, and through the Secretary of War to the United States congress, showing the necessity for more consideration to California from that body.

COULD BE FOR EITHER.

The organist was having trouble with the sexton. The old fellow refused to pump the organ except when he was ready, and then he stopped whenever he thought there had been enough music. Sunday morning came around again, and this time the organist handed him a note imploring him to stick to his post through the services. Old John, without looking at the note and without turning to observe the frantic gesticulations of the organist, handed it to the minister. He read:

"Blow away this morning until I signal to stop."

It is rumored that Harriman is endeavoring to dispose of the California Development Co.'s control of the irrigation interests of Imperial Valley to the Government Reclamation Service.

Texas is a large timber State. Its forests are one of its greatest resources. Much lumber has been wasted by clearing simply for cultivation. The Texas people are now beginning to realize the importance of conserving this wealth. Some parts of the State are treeless, and tree planting has to be done. In the Panhandle region in the spring of 1906, over 500,000 trees were set out.

The case of L. M. Holt for the objecting stockholders of the California Development Company has been won against the Southern Pacific. This has been a great surprise to the directors of the California Development Company, and the Imperial valley people are wondering where they are at.

The trouble between the California Development Company and the owners of the Salt Plant at the bottom of the Salton Sea hope to compromise their contention by the Development Company purchasing the entire Salton Sea.

Horticultural Commissioner Pease has closed a successful season of fighting the pests of his county. The work has been done for the county, but usually paid for by the property owners, but where not paid liens have been filed to secure payment.

Riverside has experimented some in the manufacture of vinegar from cull oranges, which has been of sufficient success that more extensive experiments will be made to see if it can be made commercially profitable.

Whittier has hoped for a large cannery to be constructed there in the near future.

WATCH YOURSELF GO BY.

Just stand aside and watch yourself go by;
Think of yourself as "he," instead of "I."
Note, closely as in other men you note,
The bag-kneed trousers and the seedy coat.
Pick flaws; find fault; forget the man is you,
And strive to make your estimate ring true.
Confront yourself and look you in the eye—
Just stand aside and watch yourself go by.

Interpret all your motives just as though
You looked on one whose aims you did not know,
Let undisguised contempt surge through you when
You see you shirk, O commonest of men!
Despise your cowardice; condemn whate'er
You note of falseness in you anywhere.
Defend not one defect that shames your eye—
Just stand aside and watch yourself go by.

And then, with eyes unveiled to what you loathe—
To sins that with sweet charity you'd clothe—
Back to your self-walled tenement you'll go
With tolerance for all who dwell below.
The faults of others then will dwarf and shrink,
Love's chain grow stronger by one mighty link—
When you, with "he," as substitute for "I,"
Have stood aside and watched yourself go by.

—Strickland W. Gillilan, in Success Magazine.

THE PIAZZA GIRL.

"WHERE have been six girls in the office this morning," the dean remarked, glancing keenly at the gray-eyed girl before him, "who have said that they were willing to do anything to earn a little money."

The gray-eyed girl did not flinch. "But I am ready to do anything." she answered with a smile that emphasized the significant word.

The dean turned to his desk and rummaged in one of the pigeonholes.

"There are several ladies on the campus who are in need of some one to sweep their walks every day and wash the piazzas once or twice a week. Are you willing to do that? Of course, it will not bring you much, but it is all I have to offer at present."

"I shall be glad to do it," the girl replied. "May I have their addresses? Thank you very much."

The dean, leaning back in his chair watched his visitor as she crossed the campus. Six other girls had refused the work that morning. "But it remains to be seen whether she does it, after all," he said to himself.

She did do it; every morning for nine days he passed her on his before-breakfast constitutional. She always spoke brightly, with no apparent consciousness of her broom or mop.

"Means what she says, gives honest work, no false pride," the dean thought with satisfaction. Then suddenly the piazzas had a relapse; when two weeks later he met her, he asked about it.

"Oh," she explaned, "I'm going typewriting for Professor Summer. He asked me if I could do it as well as I could sweep walks, and I told him I could. It is facinating w copying the notes of his e ments."

"I've no doubt," the dean dec "that you intend to perform e ments of your own some day."

"I'm going to try," she laughe

When he reached that point favorite story, the old profess ways stopped.

"And did she?" somebody wa to ask.

"No," he fumed, "she went married a young upstart of an structor. She swept his piazza while, till he made a reputation, she copied his notes, and I've no did half his work—he always so."

"It seems a pity," the sympat listener, lured on so far, would ably begin, only to be vehement terrupted.

"Pity? Where'e the pity? W a pity? She helped a man do work in the world, and brough three sons, any one of whom w have washed piazza floors cheer to get an education. One is bu bridges out West, one is helping brains in the East, the third is in college. I'd like to know ho woman could put her education better use."

Then he would smile and look across the campus, with its gr girls.

"I used to doubt the wisdo higher education for girls. The who washed piazzas converted he would finish.—The Youth's C panion.

RECIPES.

Lemon Pie.

One lemon; 1 cup sugar; 3 e cup sweet milk; 1 tablespoon starch; 1 teaspoon butter. Crea butter, sugar and starch. Ad milk and beaten yolks. Gra yellow off the outside of the and use as flavoring. Sque the juice and add it to the m Beat whites of eggs to a stiff Add these the last thing and well. This makes enough for pies. Bake with bottom crust

Orange Cake.

Two cups of sugar, six eggs, (whites of two for frosting,) two flour, two teaspoons baking pow one-half cup of water, one grated ange. If this makes the batter thin, use less water or more flo

To make the frosting add to beaten whites of the eggs one gr orange and stir in enough powde sugar to make thick enough spread nicely.

A good and more economical ange cake can be made by usin plain cake receipe and using the ange juice and pulp for the wet instead of milk.

Orange Marmalade.

Slice very thin twelve oranges five lemons, using the entire fr but removing all seeds carefully. every pound of fruit add one quart water and soak for twenty fo hours. Boil till tender, then add o and a half pounds of cane sugar each pound of fruit. Boil until t liquid makes a jelly—about for minutes. Some use pound for pou of sugar and fruit.

A tablespoon of lemon juice in ha a glass of water, used with a so tooth brush, will clean the teeth an harden the gums.

AND FOR BREAKFAST BACON.

correspondent of Farm Progress the following explanation of ;reat popularity of breakfast ba-

periments are in progress to find why it is that the American peo- ıave developed such an insatiable tite for breakfast bacon. The ınd has becn steadily on the in- se for some years, but in the year all previous records were en. The people simply will have daily bacon, no matter whether price be high or low or the ther hot or cold. Even in the of midsummer the demand dily continues. There must be a on for this extraordinary crav- of the public palate, hence the ef- now being made to ascertain cause.

would seem to the writer that is not a difficult understanding. act, one very good reason can be n off-hand. Breakfast bacon is only delectable—thanks partly to t mysterious process which it un- goes in the packinghouses—but is of the most nutritious meats that be obtained.

Vhen sliced thin and broiled, it kes a crisp, dainty dish that looks more enticing than a thick loin ak or huge roast. But this is not main reason, which can be given a few words: Breakfast bacon is of the most easily digested meats the market. Experiments have ıe to show that even in the case of alids it can be eaten with im- ılty. Physicians in hospitals fre- ntly allow breakfast bacon to ty- ıld fever patients who have lain months perhaps on a diet of milk ıted with water. The writer can tify to this from personal experi- e.

Recent experiments by Professor yder at the Minnesota station dem- strated that bacon not only con- ns a very high per cent of protein, that even the fat cooked out of it en sliced and broiled was, when xed with other food, also highly tritious and digestible.

t goes without saying that the sent demand is a good thing for farmer who knows how to pro- ce a good bacon hog. It is the n bacon that is at present most eferred, too much fat being a dis- vantage. It is obvious, therefore, ıt every effort should be made to oduce firm, solid flesh, which is en found in corn-fed hogs.

A BUNCH OF FAT ONES.

LAUNDRY WORK.

The reason wash day is so dreaded by the housewife and, in many instances, by all the members of the household, is because the work is not rightly managed and proper preparations made for the work of this day.

The careful housekeeper has found that her work on wash day is made much easier if the clothes to be washed can be soaked over night, as this loosens the dirt and makes them much easier to wash. A small amount of borax dissolved in the water in which the clothes are soaked is a great help in softening and removing the dirt and in whitening the clothes. Borax costs more than salsoda, but it does not injure the fabric as do the stronger alkalis, so in the end it is the cheaper.

The thoughtful woman has also found out that it is far more economical to mend clothes before they are washed, for often the rents are made worse in washing and often garments are made useless by neglect. All stains that will "set" in washing should be removed before the clothes are put to soak. The stain should be examined and removed by the process most effective for the kind.

It is best to make all possible preparations, such as cutting the soap into pieces ready to make the soap solution for the boiler, before wash day arrives. Preparations for the meals of wash day should also be made in advance.

Washing Flannels.

Great care needs to be taken in washing woolens, for unless they are washed properly, they will shrink and become stiff and harsh. It is better to have the temperature of all the water used about the same. Never rub soap onto woolen garments. Make a soap solution and put it into the water in which the garments are to be washed. Always shake and brush the garments well before wetting them. Have the suds and two rinsing waters warm and add a tablespoon of borax to each one.

Work the suds through the material by lifting, squeezing and kneading. Never rub or twist woolens. After rinsing through two waters, run through the wringer and hang out to dry, and do not allow them to freeze. Take from the line before quite dry and press with moderately hot iron.—Lotta I. Crawford, Assistant, Department of Domestic Science, State Agricultural College, Fort Collins, Colorado.

HOMELY HINTS.

Neuralgia and headache may be relieved by rubbing the affected parts with lemon juice.

You can remove a wart or corn by puttting a piece of lemon on it a few times. Bind it on.

Lemon juice prevents dandruff. Mix one part of juice and three parts of water and rub into the scalp. Loss of hair can be successfully treated in the same way.

The lemon juice has an affinity for grease, and your lemon peels from which most of the juice has been squeezed for other purposes will take the grease off pots, pans, dishes and sink, quicker and better than hot water and soap. Rub your hands with them before and after and they will be saved from that disfigurement that comes from washing dishes.

To clean brass or other metal, cut a lemon and sprinkle salt on the cut surface, rub well with this.

When stewing dried fruit, as apples, apricots or peaches, add a few slices of lemon and the flavor will be greatly improved.

When putting up cherries for future use add slices of lemon. This applies to many other fruits and is a valuable hint.

If you want a palatable apple sauce from apples that are tough or insipid, add the juice of one lemon to a pound.

Lemon juice softens the water and renders washing less difficult. It also helps to remove dirt and grease; only be careful not to use it on colored clothes.

Clothes that have been allowed to stand over night in water to which the juice has been added will clean with very little rubbing.

Lemon juice will remove ink, rust or fruit stains. Do it this way: Moisten the stained goods in cold water, lay out in a hot sun, squeeze a few drops of juice on the stain, let it dry, then repeat the juice and drying until the stain is gone.

For iron rust and ink stains put a pinch of salt on the moistened stain and then apply the juice. Repeat. Only for uncolored goods.

Better than soap—Nothing will clean oiled, grimy hands, nails or face so quickly and completely as a piece of lemon. Rub it over them and rinse off with water. It will also remove ink or fruit stains from the skin.

The juice of one lemon in a basin of water makes a cooling, cleansing lotion for the face and hands, removes the oily, greasy appearance so common in hot weather, and gives a feeling of freshness after golf, tennis, bicycling and other active exertions.

Freckles, sunburn, eczema and blackheads are removed and the skin left soft, velvety and full of life, by using one part juice with four of water—never pure.

ORIGIN OF A HABIT.

Adam was securing a better grasp on the language.

"This," he explained to our first mother, as he gave his arm a comprehensive sweep, "is the book of Nature."

Eve looked around at the trees and tender grass.

"I wonder where the last chapter is?" she murmured. "I'd like to see how the story comes out."—Cleveland Plain Dealer.

Chosen words make the rough places smooth.

Los Angeles Markets

Butter.

LOS ANGELES, Feb. 26., 1908.—Butter is lower by 7½ cents than last week. At this moment receipts are very light, but the quantity received during the past few days has been heavy, also San Francisco having shaded the prices both tend to lower quotations. However, present quotations are greater by 5 cents than last year this date.

Citrus Market

LOS ANGELES, Feb. 26, 1908.—The conditions of the citrus market are better with a large quantity going forward. Total shipments are now about 10,000 cars, which is ahead of last year this date.

Shipments.

Total shipments of citrus fruits to date 9018 cars, of which 1372 are lemons. Last year same date 7329 cars, of which 903 were lemons.

NEW YORK, Feb. 25.—Sixteen cars of navels, three of lemons and one of budded were sold. Market continues active on navels, with prices unchanged. There is no demand for poor stock lemons, but good fruit sells readily. Weather clear and favorable.

A PERFECT HOME.

'he most perfect home we ever ı was a little home into the sweet ense of whose fires went no cost- thing A thousand dollars served a year's living for father, mother l three children. But the mother the creator of the home; her re- ions with the children were the st beautiful we have ever seen; ry inmate of the house involun- ily looked into her face for the ynote of the day and it always ıg clear. From the rose or clover f which in spite of her hard isework she always found time to t beside our plates at breakfast, wn to the story she had in mind read in the evening there was no ermission of her influence. She s always been and always will be r ideal of a mother, wife and memaker. If to her quick brain, ving heart and exquisite face had en added the appliance of wealth d enlargement of wide culture, re would have been absolutely the eal home. As it was, it was the st we have ever seen.

Farmers' institute held last week at n Fernando was one of the best d most interesting sessions held.

There are but a few cars left of the uthern California celery output.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

CHOICE GRAPE CUTTINGS AND ROOTS— Cuttings, $3.00 per thousand; roots, $3.00 per hundred. Cornichon, Red Emperor, Thompson Seedless, Flame Tokay, Rose Peru, Muscat, Mission. J. C. SMITH, Burbank, Cal.

POULTRY

BLACK MINORCAS OF QUALITY—A Choice lot of large size cockerels bred to standard requirements. A rare chance to get an excellent breeder $2 to $5. One pen mated up for my own use of finest high scoring female specimens and layers, standard weight and over, to a grand cock bird which headed Geo. H. Northup's first pen last season. A few settings to spare at $3.00. J. P. McDONOUGH, Geyserville, Cal.

C. A. LATHAM STRAIN BLACK ORPINGtons—The greatest blood in the world. Won at the great score-card show 1908—2nd cockerel, 2nd 3rd 5th pullet, 2nd pen. Silver Loving Cup for best display pen of solid color. 2 club specials. Out of 8 entries won seven. Eggs $7.50 and $10.00 per setting. Eggs half price after June 1st. One trio for sale. Remember the best is the cheapest. C. A. LATHAM, 807 E. 23rd St., Los Angeles, Cal.

WHITE WYANDOTTES—"CREAM OF THE Coast" strain—the 200-per-year kind. Barred Plymouth Rocks, my "Blue Diamond" strain, are great winter layers of big, brown eggs. No incubator lots furnished. Eggs per 13, after Jan. 1, carefully packed, $1.50. Address WILLIAM C. PARKER, 111 Pacific avenue, Santa Cruz, Cal.

GERMFOE KILLS THE GERMS—GREATest disinfectant known. Sprayed about it prevents disease—a few drops better than a pound of cure. Large bottles 50c, or smaller bottle by mail prepaid same price, if your dealer hasn't it. Diluted with 50 to 100 parts water, a little goes a long way and costs but a trifle. WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

EGG-MORE, THE GREATEST OF ALL "egg-makers" and the biggest seller. Highly concentrated though not a strong tonic and stimulant. A little daily with the feed does the business. A 25-lb. $2.00 pail for $1.50, if you haven't tried it; freight prepaid by us, if you name this paper. WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

ALTADENA ORPINGTON FARM—MATSON Hayden, Box 1001, Pasadena. Golden Buffs exclusively; fine male birds a specialty. Settings $10.00 and $5.00. Five winnings at show in Los Angeles, 1908. Satisfaction guaranteed.

BUFF ORPINGTON DUCKS, THE GREAT commercial bird; good for market; great layers. Eggs now $3.00 per 12; $5.00 per 26 from our imported English blue ribbon strain. GOODACRE BROS., Compton, Cal.

DAYTON'S ROUP TABLETS ARE GUARanteed to cure or money back—not talk back—money. 50c by mail if your dealer hasn't . WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

KILLAMITE KILLS THEM—BEST INSECT powder made for fowls or plants. 50c for 2½ lb. sifting can, express prepaid by us if your dealer hasn't it. WEST COAST MILL. 818 San Fernando St., Los Angeles, Cal.

COLUMBIAN WYANDOTTES — NEVER fail to win in the hottest competition. A few trios for sale. Eggs $3 and $5 per 15. F. J. IRONMONGER, 127 N. Garfield Place, Hollywood, Cal.

WHITE PLYMOUTH ROCK SILVER CUP winners at the big Chutes Park show, January 6th to 12th, 1908. Eggs, $2.50 and $2.00 per 13. Average score of first pen 95½. ADAM RANKIN, 271 Isabel St., Los Angeles, Cal.

WEST COAST CHICK FEED MAY COST A little more, but you can't afford to feed the little ones anything but the best. Of dealers, or $3.50 cwt., f. o. b. Los Angeles. WEST-COAST MILL, 818 San Fernando St., Los Angeles, Cal.

FOR SALE—LINE BRED WHITE ROCK cockerels from Mrs. Basley's original strain. Write for prices. Also eggs for sitting $2.50 per 15. MRS. KATE B. JOHNS, Compton, Cal.

FOR SALE—SOME FINE BUFF ORPINGton cockerels. Address S. R. THOMPSON, 1734 E. Washington St., Los Angeles, Cal. Phone South 823.

INDIAN RUNNER DUCKS AND BLACK Langshan fowls. Eggs and stock for sale. Large, fine stock, with good range and strong fertility. CLYDE J. MOSS, Corona, Cal.

ARROWHEAD STRAIN BARRED ROCK eggs—$2.00 per 13. MAX JENNEY, 6526 Pollard St., Los Angeles, Cal.

WHITE MINORCAS (EXCLUSIVELY)— Best layers of large white eggs. L. V. PETERSON, Guerneville, Cal.

BERRY PLANTS.

FOR SALE—MAMMOTH BLACKBERRY, 100, $3; 1000, $25; Himalaya Giant blackberry, 100, $4.50; 1000, $35. Express prepaid to California points, ADELBERT COOLEY, Laton, Cal.

WANTED—ONE-YEAR OLD LOGANBERry plants. Address P. O. BOX 2697, Fresno, California.

FOR SALE—3000 CRANDALL'S BLACKberries, fine plants at $10 per 1000. 1000 grafted field grown roses all the standard sorts at $15 per 100—the strongest rooted stock ever offered. H. L. BAUER & SONS, 737 S. Spring St., Los Angeles, Cal.

MELON SEED.

NO BETTER SEED GROWN THAN I OFfer you. Chilian watermelon seed white or red, 60c per pound; pineapple cantaloupe seed, 80c per pound by express. Mail fifteen cents extra; supply limited. S. FAIRBURN, Burbank, Cal.

GRAPE CUTTINGS WANTED.

WANTED—CUTTINGS OF THE FOLLOWing for grafting purposes: Rupestris St. George, Riparia x Rupestris 3306, Riparia x Rupestris 3309, Riparia x Rupestris 106-8 and Mourvedre x Rupestris 1202. Address FANCHER CREEK NURSERIES, Fresno, California.

MACHINERY.

FOR SALE—50 OR 60-H. P. FAIRBANKS-Morse gasoline engine as good as new. Can be bought cheap. WAITE, BAILIE & Co., Los Angeles.

FOR SALE—10-H. P. FAIRBANKS-Morse distillate engine in A1 shape. A bargain. N. W. cor MAIN AND BRUNO STS., Los Angeles.

FOR SALE—8-H. P. HORIZONTAL STEAM engine very cheap. 943 N. MAIN ST., Los Angeles.

FARM LANDS FOR SALE.

FOR SALE—1 to 10-acre tracts on car line between Riverside and new cement works. Good for chicken ranches, alfalfa or gardening. Will sell on easy terms. Plenty of water on each tract. C. C. POND & N. R. BELL, Riverside, Cal.

FOR SALE FOR $1750—AN UP-TO-DATE chicken ranch. Five hundred Rhode Island Reds. Well advertised. Good paying business in best inland town in State. If interested address "THE RED" care of Cultivator, 115 N. Broadway, Los Angeles, Cal.

FOR SALE—40 ACRES, LEVEL; FINE for chickens, vegetables, berries, etc., $30 per acre; a bargain. WM. MANTZ, Santa Maria, Cal.

FOR RENT—FORTY ACRES OF YOUNG orchard for vegetable crop on shares, situated three miles from cannery. Owner, D. F. CONANT, Route 4, Bx 64, Modesto, Cal.

MISCELLANEOUS.

DELMONICO'S CHEF SAYS: "THE ANchor egg separator works perfectly; no well regulated hotel or household can afford to be without it." Send ten cents, or ten names of persons keeping poultry, and we will send one postpaid. WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

FOR SALE—TWO HUNDRED THOUSAND Palmetto asparagus plants. Also four varieties of almond trees. Extra fine stock of plums, peaches, pomegranates, etc. IMPERIAL VALLEY NURSERY, Imperial, Cal.

I HAVE TEN HIVES OF BEES FOR SALE on my ranch near Crafton. Address L. LODGE, 1375 East Ocean Ave., Long Beach, Cal.

FOR SALE—I HAVE TEN TONS GOOD barley hay which I will sell cheap. Call or write. WM. HUME, Puente, Cal.

HORSES.

FINE PERCHERON STALLION FOR SALE by MRS. M. E. SHERMAN of Fresno, Cal.

PLANETS.

A valuable little booklet has been issued by the S. L. Allen Company of Philadelphia, Pa., which, we understand, will be forwarded to any inquirer who requests it if the Cultivator is mentioned. Some people may not understand who S. L. Allen & Company are, but when it is mentioned that they are the Planet, Jr., people, and that the booklet is full of information regarding hand and horse cultivation, it will be seen that it is one of valuable information.

NOTICE TO POULTRYMEN.

Our liner column contains an advertisement of a poultry ranch, stock and equipment for sale. Here is a splendid opportunity for some one to step right into a good business, as the plant has been established for several years and is past the experimental stage. The owner has good reasons for selling and if you are at all interested it might be worth your while to answer this advertisement.

A friend from the north had gone to visit the Colonel, who lived in the swampy Mississippi river bottoms of Louisana. There was no mosquito netting over the bed, and in the morning, when the negro came with the water and towels, the tortured visitor asked: "Sam, why is it that you have no mosquito netting over the beds? Doesn't Colonel have any in his rooms?"

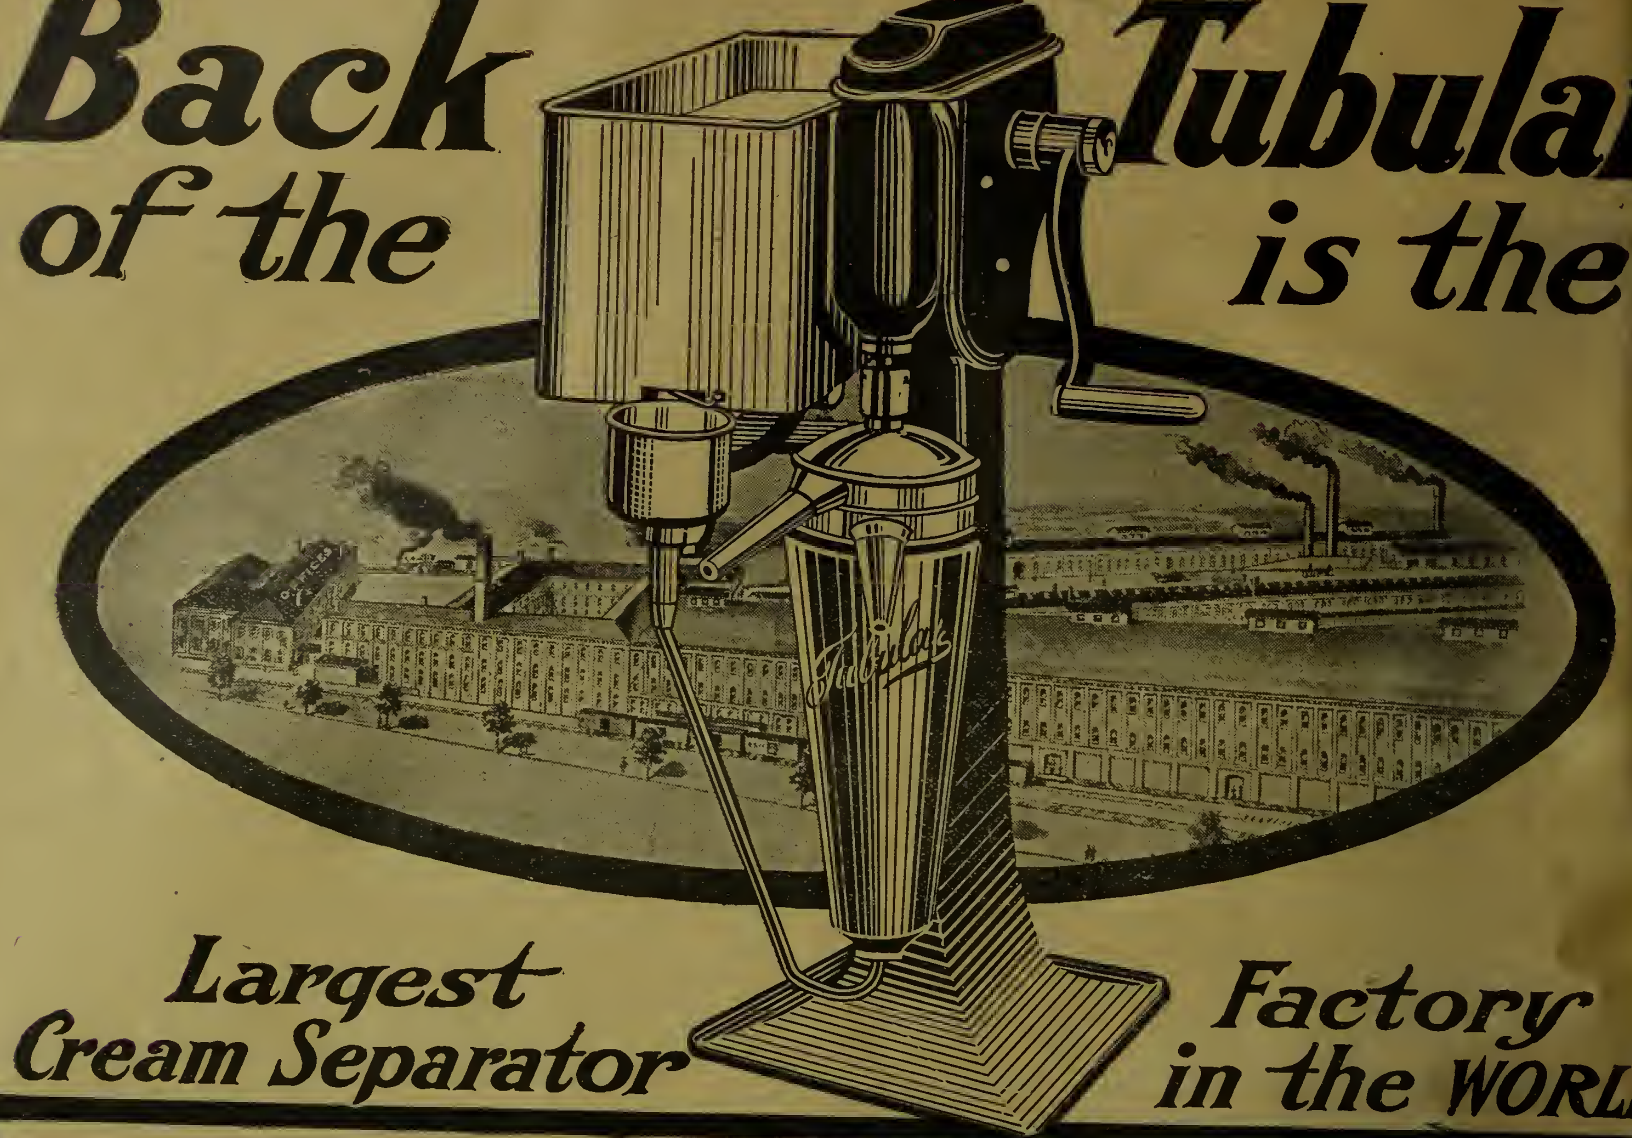
"No, suh," replied Sam.

"I don't see how he stands it."

"Well, suh," said Sam, "I reckon it's jes' dis way; in de fo' part uv de night, suh, de Colonel's mos' gen'ally so intoxicated dat he don't pay no 'tention to de skeeters; an' in de last part uv de night, suh, de skeeters is mos' gen'ally so intoxicated dat dey don't pay no 'tention to de Colonel."

The proposition of the Washington hop growers to reduce the hop acreage next year, has been reecived with favor by the hop growers of Northern California, and it is probable the movement will be general over the coast.

Back of the Tubula is the Largest Cream Separator Factory in the WORL



WHAT does that mean to you, Mr. Farmer, when you conclude to buy a cream separator?

It means that when you buy a Tubular back of your purchase stands the safest, **surest, strongest** guarantee you can possibly get—something that stands as a positive evidence its product must be the best—something that proves beyond question its product must be superior to all others, or the **largest factory in the World** would not have become necessary to fill the demand.

All the printed claims and guarantees of merit ever written can't compare to this concrete fact—this great monument of proof that Tubulars are the most popular separators on the market today.

"Nothing succeeds like success," and the reason it has been possible to build up the largest separator factory in the world, is simply because Tubulars are an actual, practical success. Because they are the best in the world.

60,000 Tubulars were sold last year; and this year, so far, promises a big increase. Every one sold makes more sales, for their buyers can't help but tell their neighbors of their exceptional superiority.

It is no longer a question whether it pays to buy a Cream Separator. That has become a fact long ago, but it is a difficult question with many as to which Separator to buy, for the reason that so many cheap, impractical and unreliable machines have been flooded upon the unsuspecting buyer. They have been advertised in most glowing terms—offered on what seemed impossible-to-be-deceived grounds, that many purchasers have been caught to their sorrow later on.

For these and many other reasons we say that it means a great deal to the buyer today what is back of the Separator you buy.

When an article has sufficient merit to succeed; to grow to be the most extensively sold; requires the largest factory in the world to supply the demand; wins in every fair competition, is it not wiser, safer, cheaper in the end to put your money and trust into that article, knowing what is back of it, than to take chances on something that has none of these buying **safeguards** to protect you?

But that is not all. In buying a Tubular you get the product of the most skillful separator builders in the world; the most practical machine genius can devise; the highest type of perfection money and brains can build—the result of a life-time of concentration and determination to produce the best separator in the world.

Don't You Know

that the growth, success, reputation and size of the business that stands back of your purchase is the best, SAFEST guarantee you can get?

It is the ABSOLUTE PROOF that the article you buy is of true merit and worth.

The bigger the business—the safer your purchase and the better the guarantee back of it.

Don't let low prices blind you. The best is the cheapest — that's a TUBULAR.

And what's the result?

The illustration at the top of this page, the factory back of it, and a record of more satisfied purchasers than all others combined.

When you buy a Tubular you have the positiv assurance that you have a separator that will get from 10 to 50 per cent more cream from your milk than any other; that it will turn much easier; that it is the simplest in construction; has fewest parts, consequently easiest to clean and less liable to breakage; has low supply can; is most durably built and is backed by the biggest and most experienced builders in the business.

Then why take chances on your separator purchase? You have everything to gain in buying a Tubular—nothing to risk. In buying a separator here are the vital points to consider:

Which Separator gets the most cream?
Which Separator is easiest to turn?
Which Separator is easiest to clean?
Which Separator has the fewest parts?
Which Separator has no back-breaking supply can?
Which Separator is most durable and costs least for repairs?

In short—get a Tubular and you'll never have cause to regret. Next to your own experience, that of others who have Tubulars, is as good a guide as you can get, especially when they tell by comparison with other makes why they prefer Tubulars. Send for our 1908 Catalog—it gives many letters on these points.

Just get a postcard and write for it today. It tells all sides of this story of separator buying; gives comparative tests of the Tubular and others; letters from dairy authorities, universities, and shows the Gold Medal awards—the highest honors ever awarded to a cream separator.

If you have an unsatisfactory separator now, write to our Exchange Department and see how easy we make it for you to exchange your old machine for the easy running, clean skimming Tubular. You'll find the Exchange the most profitable experience you ever had. Write for Free Catalog No. 260 today.

Educate the Youth of America

ident Roosevelt Heartily in Sympathy with the Greater Educational Opportunities for Rural Youth

NGRESSMAN C. R. DAVIS, of Minnesota, feels greatly en-
uraged concerning the passage in the near future of his indus-
al high school bill. The numerous endorsements from the
educational men of the United States, including favorable reso-
rom many educational organizations, farmers' associations,
lleges of agriculture and mechanic arts, commercial organiza-
ards of trade, manufacturers' organization and industrial orga-
s generally throughout the country have inspired the hope
ngress will be induced to consider favorably the measure dur-
present session.

Regarding this move to aid the youth of the farm, the President recently said in a speech at Keokuk:

"We should strive in every way to aid in the education of the farmer for the farm, and should shape our school system with this end in view; and so vitally important is this that, in my opinion the federal government should co-operate with the State governments to secure the needed change and improvement in our schools. At present there is a gap between our primary schools in country and city which must be closed and, if necessary, the nation must help the State to close it. Too often our present schools tend to put altogether to great a premium upon mere literary education and, therefore, to train away from the farm and shop. We should reverse this process."

onor Arbor Day by Planting a Tree

City Forester Edward J. Harper of Los Angeles Appeal for Beautifying the Streets of the City, Which Applys With Equal Force to Beautify the Roadways of the Country

THE TREE. I wish I could write that sentence on all hearts, for we shall ut little in developing the City Beau- he masses of our people know and have igent love of the tree. The tree has important part in the development of It has had its place in song and story, y and religion, in legend and in fact. has had an important part in every re- t has taken any large hold on the race r own Christian religion in its opening is the tree of Knowledge of Good and has so much to do with the development t parents. Throughout the pages of the es have their parts to perform in the f the church and the nation. In the ages of this good old Book, when it l us of the "Morning Land" for which nd to which we look with yearning eyes, ree hard by the river of life whose leaves he healing of the nations. I am per- at in our modern life the tree has us that will tend to the solving of the lems that are crowding upon our great

re if I did not have a revealed religion rt and bless that I should be like my the old Druids, and bow down to the the trees. So I say, **love** the tree. In- the minds of the young a respect for f the tree and the importance it bears ty's life. It is remarkable how many eem the tree, and the carelessness they concerning its welfare. The way that re allowed to break and destroy the wing trees along our streets is almost nd the utter disregard of the tree shown erage deliveryman is even worse. The struction of the symmetry of the street e utility companies is one of the worst f modern city life. All of these evils be, overcome, and only the intelligent e tree will bring about the needed re-

can be beautiful without street trees. gant mansion, though stately, can never nor really beautiful until the tree planted near to lend grace to the other- n effect. I wish to say further that it e in the long run to have a homely city autiful one, more to have an ill kept one that is orderly. Trees will cost ey and some care, but we can afford money on our homes where we expect e future great Americans. Streets that ned and beautiful are just as necessary ordered city as warehouses, counting l fire departments. I know that many nk so, but that is because they think a for the making of **money**, while I am a city exists for the making of **men**. It lly important in this age of strenuous s age of machine-made life, that we es of quiet and restfulness where we e from the turmoil of struggle for gold. o rests tired nerves as a touch of na- hing so soothes and calms after listen- click of the typewriter all day as the ghing of the trees as they whisper to r the lullaby of night. I wish that d office man and mechanic could have a home facing a street with broad parking along which well cared for trees would wave him an evening greeting. We need to make our growing youth realize that there are many things in life that money can not buy and that the soul and intellect will perish if fed on gold. Nothing will help us more than to teach them a love of the tree and to throw them in daily contact with life as manifested in the tree.

I am amused and pained frequently at the excuses that are given as reasons for destroying many of the old trees of our city. One woman wished to cut down a fine old pepper because the birds rested in it and their songs disturbed her morning slumbers. Another wished to cut down one because the leaves dropped and it was so much work to sweep the sidewalk. These are but examples of many foolish reasons that I meet in my desire to save the trees that we now have. Therefore I say, **love** the tree.

E. J. HARPER City Forester of Los Angeles.

We must plan for the tree in making our streets. Many of the difficulties we now face grow out of the fact that the tree was never taken in the count in laying out and making the streets. We have not made our streets as broad as they should be and we have not given the right proportion to parking. By so doing we have added greatly to the expense of making and keeping up the streets. In the residential districts where the streets are sixty feet wide, only thirty feet should be given to the driveway, and then on each side fifteen feet should be given to sidewalk and parking. This would permit ten feet for parking. We might grow trees in that much ground. The effect of a strip of grass ten feet wide with a row of uniform trees on either side of a street is most pleasing and would give a decidedly parklike appearance to the whole street. It would be far less expensive a proposition than the old way and would be far more homelike and wholesome. On an eighty foot street, forty feet for the driveway is far better than sixty unless there is a double car line to run along it. Sooner or later we must do away with poles and wires. The only satisfactory solution is the conduit and to that we must come. A makeshift is the alley, but when we have as few alleys as in Los Angeles we cannot even use this means of relief. I think that all cities should own conduits and lease them to utility companies, thus bringing to the city a revenue and at the same time solving one of our difficulties.

The street tree should be under the entire care of one head. This department should direct the planting, the care, the pruning, and when necessary, the removing of all trees. Sufficient force should be given the Forester and a sufficient sum of money to enable him to accomplish results. As to what we shall plant depends upon the soil, the width of the parking and in a degree the location. Most people in California prefer the evergreen trees and we have a variety that do well in this climate and that will be quite distinctive of our Southern California. Among these I will mention the camphor, the sterculia, the carob, or St. John's Bread, the acacia (some three or four varieties), the jacaranda (almost evergreen), the magnolia, the California bay or laurel, the Catalina cherry, the cedrus deodora, and, under certain conditions, a few of the palms.

But I am persuaded that we also need some deciduous trees. There is a beauty and freshness about them that the evergreens never give us. Of these the oriental plane, or sycamore, the tulip, the white ash, the California maple, the horse chestnut, the elm (though it does not do well in Los Angeles), and some of the oaks.

I am sure that we should give more attention to the planting of slow-growing trees, as they are long-lived, and we need to plant for the future as well as for the present.

A GREAT CONVENTION.

A great convention is being planned for Riverside. State Commissioner Jeffrey was down from Sacramento last week and informed us that plans are perfecting for many new features.

Mr. Reed, of Riverside, sends in a first draft of some of the features of the convention. Tuesday, April 28, will be given over to addresses by Mayor Evans, Governor Gillette, Commissioner Jeffrey. Later in the forenoon J. H. Reed will lead in an address on handling Citrus Fruits, the main points of which are founded on Powell's investigations. That will be followed by extended discussion, in which Mr. Powell will lead.

In the afternoon Elbert Lyon, of Redlands, James Mills, Riverside; C. C. Teague, of Santa Paula; Mr. Allen, San Diego; Commissioner Jeffrey and County Commissioners Cundiff and Pease, will discuss Citrus questions.

Other names appearing on program to follow are: F. L. Palmer, of Pomona; Mr. Lindley, Geo. C. Roeding, Fresno; B. J. Jones, San Dimas; C. E. Rumsey, Riverside; F. P. Hasp, Oceanside; Leonard Coates, Morgan Hill and many others.

Four days packed full in which is one evening reception by the Woman's Club of Riverside. The full program will be given in the Cultivator as soon as issued.

Kubelik, the famous violinist, made his start as a market gardener. He is 27 years old, married to a Bohemian Countess and now is very wealthy. He earned his money to buy a violin from produce raised by his own hand on a little garden.

Sixty per cent. more students registered at the State Agricultural College, Salt Lake, January 1st, 1908, than registered a year ago at the same date.

CULTIVATION AND IRRIGATION.

WITH the great variation in types of soil found in our fruit growing sections it is impossible to lay down any definite rules for the application of water or cultivation of the orchard. Each grower has a problem of his own and he alone can best solve it. However, a few important principles may be suggested which will aid the observing orchardist in the proper handling of his particular soil. Careful observation and common sense will do much to overcome difficulties now commonly experienced in irrigation fruit growing.

Plow Display.

Many of our soils are too heavy to be easily handled under irrigation as commonly practiced. With frequent irrigations and meager cultivation they become hard and refuse to take water properly. Careful irrigation and more rigorous cultivation will do much to overcome this difficulty. Heavy soils should be plowed from six to eight inches deep at least once each year. The destruction of small roots by the plow will do no damage, while the breaking of larger roots may be avoided by shallow plowing near the tree. When once outside the confines of the ditch, the lateral movements of the water are much more rapid than downward, and as a result, the surface soil is saturated to the extent that the benefits generally derived from plowing are lost. The soil is run together, and before it is in shape to cultivate, it is hard and baked. This is especially true of the soil at the upper end of the orchard, when an attempt is made to water long rows in newly plowed land. This is also a suggestion to those who have a crop to plow under in the old orchard or land to prepare for the young orchard. The earlier this crop can be turned under the better. The young orchard on late plowed alfalfa land ofte

GRAFTING WALNUTS.

One hundred and fifty walnut trees in the Neff orchard southwest of town will be cut back in a few weeks to be grafted to a variety resistant to the blight. These trees are fourteen years old and have attained a fine growth, but lost half their nuts the past season from effects of blight. During the past year Mr. Neff has looked over many orchards in Southern and Northern California for trees showing qualities resistant to the blight, and some months ago discovered in his own orchard a tree which seems to fill the bill. This tree produced 200 pounds of nuts last year and seemed to have very little blight. Grafts from this tree will be taken and attached to the trees that blight. The work will be done by an experienced nurseryman from the North who has made an especial study of this method of ridding orchards of the blight.

A number of growers throughout Southern California have grafted a single tree with resistant stock, but Mr. Neff will work over ten acres of his orchard at once. If the grafts prove successful, and of this he has no doubt, he will graft a larger area next year, and continue until his entire orchard has been reset with new growth.

He expects these ten acres of grafted trees will in four years produce three times the quantity of nuts than the trees now covering the tract. These trees have been carefully attended to since being set out. They have had cover crops and fertilizers according to scientific treatment and have made an excellent growth, yet they annually shed half their crop. The tree in the orchard which shows resistant qualities came from the nursery and was planted at the same time. However, it is a fact well established by experience, that different variations in nut trees are produced from nuts taken from the same tree.

This will undoubtedly be the largest area grafted in any walnut orchard in the State, and has already attracted widespread attention in various sections. The operation will take place in March, and due notice will be given so that growers may witness the process.—Anaheim Gazette.

DISCHARGE THE JAPS.

Now is the time when some of the ranchers hereabouts might with much of advantage to all concerned, and not the least of this advantage to themselves, by any means, discharge any Japanese they may have in their employ as farm hands and give the work to the many unemployed white men in this vicinity.

There has been a time in the past when good, reliable white men were not to be had. White men there were—white in color, that is—but not reliable men. The good-for-nothing hobo has ever been with us in some numbers, and it is not to be expected that any rancher will hire an unreliable man, no matter how loud the shouts of the agitators—who are as ever with us as the hobo. But it is different now. There are a dozen good, hard working white men hereabouts for every job. They are bone of our bone and flesh of our flesh, and every dollar they make they will spend with us. Some Japanese are still holding the jobs they secured while white labor was scarce. It may be some trouble to the rancher to break in a new man to do the work, but his duty in the case is very clear. It is no time for the employment of Japanese while white men are suffering.—Redlands Review.

Not Connected With Other Stores

Intelligent Buyers Appreciate Our Methods

Stores using the sensational special reduction and great discount methods are often considered low priced, while stores transacting business on a straight price system are assumed by many to be high priced. A little careful consideration will show you the error of this assumption and convince you of the advisability of buying under our system of pricing and selling, furniture, carpets and draperies.

Our Store Is the Low Priced Store

We have but the one price for all and that price is as low as it is possible to sell good qualities. If furniture is originally priced right there can be no special reductions or discounts. Stores employing such methods must price their goods high to provide for the great reductions. Such stores must then be high priced and you are paying much more than the goods are really worth. Our every day, plain figure prices are the right prices and are lower than you will find such goods priced elsewhere. We have the largest and finest stock on the Coast.

With the Citrus Growe

SOIL TEMPERATURE A FACTOR.

NITRIFICATION in the soil takes place most rapidly when the temperature approaches 90 to 100 degrees.

Orange roots naturally seek this soil zone and there may be nothing gained by forcing them below this if such a thing were possible, and much may be lost.

The Florida sour stock roots much deeper than other varieties of citrus stock and on that account will withstand more drouth, but individual trees which have a large surface root system produce more fruit than those which have a larger percentage of the roots deeper in the soil. This was discovered at the Pomona Experiment Station. An examination of the soil showed that at three to nine feet below the surface the soil contained more than sufficient moisture for the needs of the trees at all times between irrigations. The orchard had been irrigated at intervals of six weeks to two months, the water having been allowed to run three days at a time.

This was to induce deep rooting. Still it did not have that effect except on those varieties which naturally grew a deep root system. It is true that stray roots could be found eight to ten feet deep in most cases, but 80 degrees to 90 degrees of the roots of sweet orange and pomelo trees were within two feet of the surface. The orchard was never plowed but in one direction each year, but each year it was plowed crosswise of the direction in which it was last plowed. The cultivator never cut as deeply as the plow ran, and when the plow cut through the strip of land that had not been turned for two years, the soil was a mass of orange roots, showing that with deep irrigation and no fertilizer there was a strong tendency for the roots to grow near the surface.

Why was this? No fertilizers were applied, and as the surface in such places was comparatively dry during the irrigation season, shallow application of water and fertilizers were not factors in developing a shallow root system.

It is our opinion that the temperature of the surface soil during the growing season has more to do with the development of a shallow root system than soil, water and fertilizers.

This being the case, is it desirable to force the roots deeper than is absolutely necessary to give space for the fine earth mulch? Some of the most productive groves in the State have never been plowed, the roots being allowed to collect just beneath the reach of the cultivator when it was run shallow. A liberal supply of stable manure and commercial fertilizer on a light sandy soil makes this possible. These conditions have been noted in several places, but where the soil is heavy we have never seen an orange grove successfully handled in this way, but other things being equal, there is much evidence that the shallow rooted orange tree so handled that these roots are kept in good tion and not mutilated, bears t fruit.

The following table is sug that the soil temperature is a argument in favor of a shal system. The figures were obt the writer on the Chino ranch gust 15th and 16th, 1901, and fair average of temperature ta a number of days during the Standard government soil the ters were used.

It will be seen that at six inc soil remained close to the m vorable temperature for the w of the soil bacteria, which prom fertility of the soil.

FARMERS CALL FOR A PREVENTIVE.

PANICS are mischievous! an exception! Even the caused by a mouse in a seminary wastes energy, tim money. Almost all panics ventable. Financial panics a uted to many different causes. Some one said our last was by somebody calling for a dolla not getting it. Ruin seized the try because of suspicion. Distr the stability of our "financial tutions" made people hoard money under the mattress or in in the wall. They feared to tr to banks.

How can this distrust and f overcome?

In the easiest and most way—by having banks wholly t worthy.

How?

By having all the resources o government of the United Sta the resources of the American p back of them.

Over $700,000,000 of the Brit tion's money is held in postoffice ings banks by the British governm This is available at any time, or no uanic, at any postoffice sacting savings bank business United Kingdom. This fact renders financial panic an alm solute impossibility.

It may recur to you how M telyou's throwing on the $100,000,000 of United States T money, stayed the late panic i United States. It will be easy to realize what a power this 000,000 of the people's money, available, would be as a panic er.

Further, if the workers of Britain can amass this en sum, it is fair to infer that h postoffice savings banks here would at least hold as mu capita for our population, or 000,000. Fancy the effect of t mendous aggregation of the p capital, always absolutely s ways get-at-able, in all parts land. Would not this two b make any such event as our scare look sick and silly? T would be no temptation to any o hoard money in old stockings postoffice savings banks would be safer—impregnable.

Do you say "we ought to them?"

Of course we ought.

Why don't we?

Because, my dear reader, you h not asked for them.

Will you write your congress and senator today and tell them pass that Postoffice Savings B Bill, P. D. Q?—Edward Herwick, cific Grove.

BENEFIT FROM COVER CROPS.

This series of articles reprinted from advance sheets of the report of the State Horticultural Commissioner of the address of James Mills, of Riverside, before the recent State Fruit Growers' Convention, will be concluded next week. We hope to include at that time valuable tables which Mr. Mills has compiled.

Pulverize.

Observe then. You go into a field. It has been plowed when it is a little wet; there are lumps the size of your hat, the size of marbles and on up to six inches or more in diameter. You know that you can not get the fertilizer elements in that. There are vast quantities of fertilizer inert in the soil that must be gotten by the friability of the soil. There are forty thousand pounds and more of potash in the first six feet of California soils, and I have no doubt there are from six thousand to eight thousand pounds of phosphoric acid in an acre; that there are over one hundred and forty thousand pounds of lime; not so much humus, not so much nitrogen. But you have got to pulverize your soil into the very finest condition of pulverization if you expect to get out of it the result. You go on one man's soil and say "How beautifully it pulverizes under the plow and the cultivator," and you go on another's soil and you see it in jagged lumps. You see in one field a large crop; in the other, a small crop. One man has great barns overflowing; the other has barns with the clapboards rattling in every breeze that blows from the four corners of heaven. You see his fences with moss on them because he has never been able to attend to them since the days of long ago. The one is the successful farmer, because he is getting out of the soil that which is in it for him; and the other is not getting it, because he has not properly worked the soil.

Warmth Necessary.

The temperature of the soil is affected by the humus, also. You take one soil and it is a dark color. The bacteria will be active with warmth in the soil. Bacteria will not be active under 47 degrees of temperature and they reach their greatest activity at about 97 degrees; therefore, we must see to it that we keep our soils warm. A dark soil is warm. Humus makes the soil dark. You may know, then, from the color of your soil whether you have a humus soil or a soil wanting in humus. A soil that is black will be several degrees warmer than one that is light.

Must Keep Out Heritage.

You know that we have about ninety millions of people in this country today; that we will have one hundred and twenty-five millions of people in thirteen years, according to a report of the Census Bureau; that we will have two hundred millions of people in 1950, and three hundred and twenty-five millions of people in 1990; and these three hundred and twenty-five millions of people must live off the soil that today is keeping measurably prosperous ninety millions of people. We are not the owners of this soil; the Almighty did not give it to us as our own. We have the title deeds today, but tomorrow we are dead and gone from the land to which no one ever returneth, and it goes to another, and it is your duty and mine so to conduct ourselves in the management of these soils that we will leave them richer than we got them. Not that it will cost us money to do it. Be assured that the men who are down at Berkeley, in Michigan and Dakota and all the states are endeavoring to teach us this principle of the handling of our soils, that if we keep them physically well by proper manipulation and put back the humus that we take out, we will get greater returns from year to year. For every dollar we expend in restoring the fertility of the soil we are repaid two.

How to Restore.

Go down South to the slave states. When they had the slaves it was easier to go out and clear another hundred acres than it was to restore the fertility of the one hundred acres which the cotton and the tobacco and the corn had exhausted, and so they went on clearing acre after acre and leaving behind them drifting sand. They are re-establishing that today by growing cover crops of cow peas. They are doing the same in Illinois and all over the continent—re-establishing the conditions that were in the soil when they were laid down by Nature, by the growing of cover crops. Take a cover crop, then, and let us grow it. We will take a cover crop of barnyard manure to restore the humus. Go out and buy barnyard manure, buy what you can, but we find that we can not get enough of it to restore the soil. And if you could get it, we find that it costs from $300 to $700 for a ten-acre orchard to get barnyard manure to the extent of ten cubic feet to the tree. Now, if we all demanded that, and did not use the cover crop, we would not be able to pay for it, even if we could get it. But we find that by growing the Canadian, the Russian blue, the cow pea of the South, and all the other several varieties of cover crops, we can not only get it at a nominal cost, but we restore the aeration and ventilation of the soil and give to the soil the organic acids that are necessary to make available the mineral fertilizers that are there for our use.

Take the cow pea or the red clover, they ramify the soil from every direction. I have followed a cow pea three feet into the soil. Why do you plow? That the air may get into the soil. Did you ever have a plow that went three feet into the soil? Did you ever have a plow that would lay up humus three feet deep, or with which, if sufficient air gets into it, will make humus? The cover crop will do it for you. Your cultivator will move through it easily; your horses will not sweat as much; they will grow fat on half the feed they would require when plowing and cultivating in a dead soil that closes up as soon as you go over it; but with the humus brought about by the cover crop your soil will be so friable and so free and so light that your cultivator will move easily and you will get a dust mulch to hold the water down that you can not get in a soil devoid of humus.

Humus is Life.

This humus, let me again say with all the force that I can, is the life of the soil, and without it all life is gone and you can not live with the soil that has lost its humus. Have you ever seen a man plowing a field when it was wet? He says, "I have got to do this, because tomorrow I have got another field to plow.' What was he doing? Making adobe bricks! He could make them quicker than any Mexican that ever puddled them with his feet. He made his soil dead, and it will take him years to restore the evil that he did in that one hour. The bacteria died

in the hardened soil, because it could not get air, and the soil became dead; and if you could take a crusher or if you could take a miner's mill and pulverize all that soil, at a million dollars cost on a great big acreage, you might reach it in a little shorter time than otherwise you would, but it would take a long time to get it, nevertheless. Therefore, remember that you can not plow a soil when it is wet. Remember that you must use the humus. Remember that you can get that humus cheaply through the cover crop. It will cost you about $35 to put a cover crop on ten acres. The root system ramifies the whole soil.

I will read you in a minute the two experiments which I made by analyzing these plants in the laboratory, to show you how much mineral fertilizer was got out of ten acres of soil and how much nitrogen. The cover crop is to get first the nitrogen. There are three million—am I right?—pounds of free nitrogen at your command from every acre of your orchard field. By the growth of the cover crop the little bacteria in the soil will go through the hair root and you will soon see tubercules growing. The little bacteria are taking in the nitrogen and giving a portion of it to the plant in exchange for starch, and if you analyze that you will find an enormous amount of nitrogen has been gotten from the atmosphere for nothing.

Cheapest Way to Get it.

What do you pay for nitrogen? $60 for nitrate of soda, with only 16 to 18 per cent available—in the ton 320 pounds of nitrate of soda for $60—three cents a pound. But I can prove through the laboratory that I got 2000 pounds of nitrogen from the atmosphere for the $35 that I expended and put into the cover crop. In growing a cover crop you are growing it to get the nitrogen, so that the mineral already in the soil may be available. Therefore, do not feed your soil with nitrates before the planting of the cover crop; do not feed nitrates; feed them phosphates, feed them potashes, and they will grow better and gather more nitrogen for your use.

There are 40,000 pounds of potash and 7000 or 8000 pounds of phosphorus available to the acre and about thirty-nine per cent. of the phosphoric acid. Yet, nevertheless, you have no right to exhaust that store. It is to do for all time, and more of that inert material will become available by your using somewhat of the commercial fertilizer that will cost you from $20 to $35 per ton. You will get more nitrogen. Your crop, because of the prodigality of your soil, will be better, your bank account will be greater, your wife's smiles will be brighter, your children will be clothed better, the conditions surrounding your home will be immensely improved, you can send your children to the best schools in the land and give them the opportunities that others get, if you will rightly operate the soil that you have got in your power to operate.

Yes, I say that you can become rich on ten acres of soil in California. I say you can! I have seen it done. I have seen a man in fifteen years worth $75,000 with a start of just $400 after the payment of his land, planting his orchard, growing it, buying others with the profit and being worth today $75,000 and off his orchard getting $15,000 net income this year.
But he was an ideal farmer
everything that the soil requ
he became rich.

JLPHUR MATTER AFFECTS 'HE TREE PLANTING.

owing the effect of govern- interference with trade, the men state that the recent agi- igainst the use of sulphur in fruit has given a setback to ıting of drying fruit, and that, he demand for peach stock n good, there has been a falling off in the demand for g the past planting season, ly as regards the drying va- the demand being almost for shipping and canning va- On the other hand, there ı an active demand for prune eavier than for years past. s been aided, too, by the good hich prunes have commanded the past season.

FRUIT PROSPECTS.

not always safe to play the ı prophet, yet with strong in- s, we may sometimes reach ble probabilities, so for the season the probabilities all a good crop of fresh fruits northern counties. There ı little frost, and no killing uring the winter, but it has ıtinually cool and there have been no hot days to start the sap prematurely in flow. As a result, all fruit trees are backward in blooming this season, which gives assurance that they will not be in bloom at the time of probable late frosts or in full bloom during the heavy March rains. So we may hope to escape killing by frosts and the washing out of the pollen by the late rains. Most deciduous trees bore lightly last season, so we may hope that, having had their season of rest, they will make up for it with heavy crops this year. Reports from the different fruit sections are to the effect that all trees are now loaded with plump and promising fruit buds, so that all things being favorable, we may count on a heavy crop of fresh fruits.

PREPARING SOIL FOR MELONS.

Commenting on preparation of soil for melons, the Imperial Standard says:

With the growth of the cantaloupe industry in the valley not enough is being said about the necessity there is for getting the land in perfect condition, selecting the seed and caring for the plants properly.

Up to the present time, throughout the valley, fully one-half of the effort put forth to produce cataloupes has been thrown away.

Each year the acreage harvested is but about one-half of that planted, simply because each year there are enough beginners in the growing of cantaloupes who fail to keep up the percentage.

Even at Brawley, with the experience the growers there have had, it is expected that the producing fields will this year not much exceed fifty per cent of the acreage planted, because there are so many new people going into the business, and the new people almost invariably think all they have to do is to stick seed in the ground.

This is nothing against the cantaloupe industry. It is simply one of the many illustration that in this world one must pay for success with industry and close and intelligent application to the task in hand.

Because other communities have illustrated the need there is for extreme care and diligence in growing this crop, the farmers about Imperial and other sections of the valley who are going into the business for the first time this year should exert unusual precautions:

First. By getting their land in the very pink of condition.

Second. By making sure that their seed is of the highest grade and not gathered up promiscuously from some other district where the farmers use their culls.

Third. By caring for their plants as they would for a treasure of priceless value.

Fourth. By studying most carefully the condition of the melons when the harvest time comes, and picking them at just the proper time.

YOU CAN IRRIGATE YOUR UP-LANDS WITH AN I. H. C. GASOLINE ENGINE

NO need to go up stream and construct miles and miles of ditch to get the water high enough.

Place one of the powerful I. H. C. gasoline engines on the stream where it is nearest your land. There are large engines for irrigating on a big scale and smaller engines for small farms.

These engines are the best means for raising and utilizing the underflow; also for raising water from lakes, ponds, and wells, and also running streams.

They will raise all the water you need and deliver it just where you want it—in the ditch or in laterals.

The first cost of one of these I. H. C. gasoline engines is, in almost every case, less than the building of a long ditch to enable the water to flow naturally to the land.

And the cost of running is always less than the cost of keeping the ditch clean of drifting sand, silt, weeds and fast growing bushes.

In many cases, an I. H. C. engine enables you to reach the knolls and other high places which you cannot reach at all by ditch without expensive flumes that are "tumble-down" and must be repaired every spring.

The engines are made both vertical and horizontal and in many sizes from 1 to 20-horse power. They are easily controlled and run dependably. The irrigator does not need to give them constant attention.

Only an occasional return to them, to replenish the fuel and water supply, is all that is necessary. One man can handle the head of water in the field and at the same time attend to the engine.

International local agents will furnish catalogs and give particulars on all sizes of irrigating engines. Or write the nearest branch office.

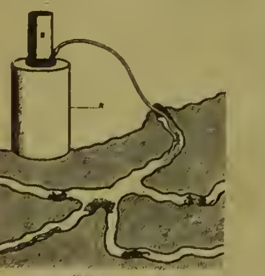
TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

THE O. & W. THUM COMPANY
Manufacturers of Tanglefoot Fly Paper
Grand Rapids, Michigan



Kill the Pocket Gopher, Moles and Squirrels

The Peerless Destroyer generates gas from carbide (a cheap substance, which can be bought anywhere,) instantly forces the gas into their holes at the rate of five feet per second, for hundreds of feet, making a wholesale killing of every live thing therein. They stop breathing when the gas overtakes them. No pumping, no trouble. The gas is harmless in the open air, but confined in their holes kills them by the dozen in a single operation. Not an experiment, but a sure thing. FULLY GUARANTEED. Perfectly safe, easy to operate, fully meets the demand for a wholesale destroyer of the pests. Will last for years. The cost is nothing for the work it will do. Full equipment, including sufficient carbide to clear any ordinary ten acres, ready for instant use, sent express prepaid on receipt of price, $5.00. Your money back if it fails to do the work. Write today.

The Vegetable Garde

THIS MONTH IN THE GARDEN.

WHILE it is presumed all the hardier vegtables, as peas, lettuce, etc., were planted last month, some of them, especially the two just named, should be planted again this month, so as to have a succession. The radish is another vegetable that matures quickly, and is only really good when grown fast so that it is crisp and tender. It is a good plan to plant a few every 15 or 20 days.

In planting peas as late as this month, keep in mind that the weather will be very much warmer by the time they mature, and to help keep the roots cool and moist, it is a good plan to make the furrows deeper than usual, but at first only cover the seed to the depth of a couple of inches. After they are five or six inches high hoe in the soil so that the furrows are a little more than level full. This rule will be a good one to follow with potatoes. Seeds of tomatoes, peppers and eggplant, may be sown now in the greenhouse or hotbed or sunny window. They can be transplanted into open ground the first or second week in April. Toward the latter part of the month you might try a few melons and cucumbers in open ground, but do not be surprised if you have to make a second planting later. Much will depend upon the season.

I have for several years used pieces of cheese cloth as a protection to early plantings of melons, cucumbers and string beans, and often secured a good stand when only failure would result without this protection. Make the cloth into squares that will be three-fourths of a yard each way. Take two pieces of wire about two feet long, each and bend them into a half circle, crossing one over the other and pushing each end into the ground firmly. Then spread the cloth over the wires and cover the edges with soil to hold it in place. The chief advantage in this form of protection is that it excludes insects and shelters from the cold, harsh wind.

It is labor lost to plant lima beans earlier than April in open ground, unless you have first started them nicely indoors in pots. By indoors, I mean the propagating house or hotbed. If the weather is unfavorable and they get badly chilled it is difficult to get them to start into vigorous growth again. It is often better to plant fresh seed, which, being put in at a late period, find better conditions for the growth. Keep the soil well cultivated.

It should be several weeks before any irrigation is used. The soil is full of moisture, if you will but retain it by good cultivation. Remember, irrigation lowers the temperature of the soil, and at this season you want to keep the soil warm by every device at your command if you would have your crops grow rapidly.

Some of the earlier varieties of sweet corn can be planted with safety the latter part of the month. If you plant only a small quantity do not make the mistake of planting it in one or two rows, unless the rows extend in the line of the prevailing winds. Otherwise, the wind blowing across the row will carry most of the pollen away and the result will be very few grains of corn to the ear. It is better to plant in a square, if but a small quantity is planted.—Q. A. L.

SHIPPING VEGETABLES

A prominent Louisana veg
shipper gives the following m
before the State Horticultural S
as most satisfactory in shipping
tables from that section:

Beets, turnips, parsley, sh
mustard and spinach packed for

THE REAL TRUTH.

, let me tell you the real truth that Lawson pink story. I had ist who experimented on a car- . One day he brought me a of the blooms. I took them to Lawson. She thought them retty; so did I, so I secured all vere of them, perhaps a dozen a or so. I told the florist how pleased Mrs. Lawson was with them, and he named it the Mrs Thomas Lawson pink. One day he came to me and said that a man named Higginbotham from Chicago had offered $5000 for the pink. "What, $5000 for a pink? Is he bughouse on flowers or money?"

He explaned to me that next year there would be fully two hundred of the pinks in bloom and they would readily bring $2 apiece. Higginbotham raised the price to $25,000.

Then we took off our coats and got busy. When I got up from that sit down—we always take off our coats and sit down when a deal gets up to $20,000—I paid the florist $30,000 for the flower and agreed to spend $15,000 in the next six days advertising the fact that I had paid $30,000 for the pink. He was to have a third interest in the deal and I was to have two-thirds. In less than eight months he returned to me. In the meantime I had spent some $40,000 instead of $15,000 in advertising the pink, directly and indirectly. He handed me back my original capital, with $15,000, which was a fair percentage, as we figured it, in business, and I presented the famous pink back to him, and today it is probably the most successful flower of that or any other kind that man has ever commercialized.—Thomas W. Lawson in Agricultural Advertising.

GLADIOLUS.

Notwithstanding the wonderful development which has been brought about in the gladiolus its culture is extremely simple, its tastes being quite similar to those of the potato. A light, sandy loam is the best soil. The corms may be planted at any time. They flower the same season and may be dug and stored after drying or may be left in the ground. Cutting the flower spikes increases size of bulb, which requires four months to come to maturity. Gladioli are propagated by (1) natural division from the parent corm; (2) seed; (3) small corms growing at base of new corm.

The seed have produced flowers the second year in California. The small corms usually do the first year.

SPECIAL TOUR.

Among the advertisements which appear in this week's issue is a special Tour to Japan by the oldest touring firm in the country. Thos. Cook & Son have been operating these tours for 67 years and have a worldwide reputation, and thousands of tourists stand ready to testify to their ability to give more for the money than can possibly be had by the ordinary method of travel at a much greater cost. The program they offer gives a full story illustrating many of the scenes, and well worth the asking which is all that it will cost you.

KEEPING THE GRINDSTONE TRUE.

The average grindstone on the farm sees pretty tough times. The softer the stone, the harder usage it receives. Its lot is almost as hard as that of the "boy on the farm," who has to turn it by the hour. The grinding surface of the stone is more apt to be concave than it is to have an even face, or slightlly beveled surface.

The concave condition comes from grinding axes, scythes, machine knives, etc., with their edges lengthwise of the stone instead of across it. This can not be helped in grinding some tools. But when the stone does assume this shape, making it impossible to grind a chisel or any flat-edged tool decently, it is a good time to get a spade or two—spades are usually dull—and hold them on the stone until sharpened, when the irregularities in the surface of the stone will have disappeared.

A grindstone, by the way, should never be left exposed to the sun. The weight of the handle will always cause one portion of the stone to remain uppermost, and this, from exposure, will reach a different degree of hardness from the underside, so that after a while the stone will be ground out of a circle. If the stone has to stand in the open, a flat box can easily be obtained to serve as a cover.—G. E. M., in Prairie Farmer.

Bees and Their Ca

ADVICE TO BEEKEEPERS.

Beekeepers of the North Yakima district are not in accord with the suggestions of Professor Melander, of the State College, made to the horticulturists at the convention at Walla Walla. He told the fruitmen to spray, among other times, just at the opening of the blossom and before it had arrived at maturity. Beekeepers think it wrong advice. They believe that spraying at this time will do an injury to the blossom in istelf, and also by driving away the bees which cross fertilize. They also think it will be harmful to the bees, which will be killed in their work by the poison on the blossoms. They protested against it at a meeting held last week.

A paper was read to the convention by Jesse Thornton who said among other things, under the caption "The Marketing of Honey," the following:

The first thing is to have good honey. To secure that there must be good pasturage for the bees. The best honey is alfalfa honey, and white and sweet clover come a close second. The one-pound section is the most popular way to take the honey at the present time. It should be put up in neat packages, properly labeled, with a showy advertisement with the producer's name and the name of the apiary, also the producer's address on each section. The honey should then be graded honestly, the white, red and yellow separated and graded. Fancy honey should have all sections containing well filled combs, straight and firmly attached to all four sides, unsoiled by travel and stain or otherwise, and all cells sealed except the row next to the wood.

No. 1 should have all sections well filled, but might contain crooked or uneven combs, detached at the bottom or with but few cells unsealed and as free as possible from travel stain. The section should be scraped clean from propolis.

It is most necessary that producers deal honestly with the consumer in order to build up the markets. It is evident that good honey should bear a higher price. When ripened up by the bees it is predigested and is very wholesome.

The extracted honey should be ripe before it is extracted and each grade of honey should be extracted by itself so that the consumer can get the kind he wants and that there may be no mixed grades. Each dealer should have one, two and five and fifty-pound packages with a showy label giving the name of the honey, as to its kind, the name of the grower and of the apiary. These should be sealed so that they cannot be tampered with without breaking the seal. This is made necessary by the bad reputation extracted honey has had by being adulterated. It is a good idea to give away samples of honey so that people may know what they are buying and whether it is wholesome. The Federal Government is desirous that the bee industry be fostered and built up, hence it has printed several bulletins on the subject. Farmers' Bulletin No. 75 treats of production and care of extracted honey. No. 59 is on bee keeping and No. 55 on queen raising. These may be obtained free from the Department of Agriculture, entomology department.—Portland Oregonian.

POISON AND THE BEES

Will the codlin moth be ex
nated in this valley at the ex
of the bee industry; will the o
pest and the little honey mak
together? Is the question whi
agitating seriously many men
section of the State, says the
Walla Union. While men have
fighting with deadly poisons the
lin moth, the curse of the orch
the same men with the same p
have been killing bees by the
lions as they attempt to suck
nectar from the poisoned blos
upon the orchard trees. The
lem is becoming a serious one.

Bees have been kept in most o
orchards of the valley for
years, and with splendid results,
til the codlin moth became so tr
lesome that spraying was res
to generally. While spraying
ineffective in many cases so fa
the pest was concerned, the be
dustry suffered from the start,
was found that even though
tle of the poison reached the peta
the blossom, it proved a death-
ing agent to the innocent bee w
it sought nectar to carry to its h
for winter. It is estimated
from 40,000 to 60,000 bees form a
ony, and in some cases half the n
ber died before the steps were ta
to prevent further poisoning.
fact, it is almost impossible to k
bees from an orchard while it is
bloom, even though the hives be
moved several miles from it. Th
are thousands of colonies in this
ley that have suffered severely fr
the calamity.

The trouble has practic
brought about a change in the fe
ing of bees. Orchard blossoms h
been given way to the delicate
ple petals of the alfalfa fields,
the places which knew the bee
in years past will know th
more, perhaps, until a po
found that will kill moths and
bees, or until the moth shall h
disappeared entirely. While in f
er years bees abounded in all
small orchards, now they have
moved back toward Hudson B
where alfalfa fields cover a
part of the country, where no
chard trees have to be syrayed

The experience of this valley is
the experience of the Yakima
Wenatchee valleys, where spra
has wrought even greater havoc t
it has here. In Yakima, it has
held by many that bees could b
longer raised where trees
grown, and in consequence the
industry has followed the a
fields back and back as the or
encroached upon the older field

CLIPPING QUEENS.

Many who have only hunted
queens during the summer mo
believe clipping to be a seriou
when, in fact, it is the most p
work the apiarist has. At th
ping season there are, as a rul
few bees in the hive and the q
can be readily found by the mo
experienced operator. In clip
either a sharp pen knife or sc
may be used and it is best to c
only one side. Queens having the
wings clipped equally on both si
unless cut very short, are frequentl
able to fly after ridding themselv
eggs. Moreover, when it come
hunting up a hundred or more q
every spring to see whether they ar
clipped, it greatly lessens the task i
only one side is clipped.—Col
Rural.

ıeries and Replies

ns to be answered in this department should be received at this office ek before reply is expected. Write plainly on one side of the paper and ll name and address. Unsigned communications receive no attention.—

VETERINARY.

a driving mare which, driven at a fair rate of lows a great deal. That is, thes very fast, but makes no an you give me a cure?—H. sonville.

obably has the "heaves," but possible to be certain from scription. You had better your veterinarian in Watson- he is as good as any in the

Mange.

I have a pet goat on which there are sore spots which are continually getting larger. Seems to be a skin disease. The wool will pull off in great patches at times showing a new spot which is slightly scabby or scurvy. What is the trouble, and can I cure it?—Subscriber, Los Angeles, Cal.

The goat probably has mange or scab. Get a quart of one per cent solution of formaline and water. Thoroughly scrub the parts two or three times a week using a small brush. Clip the hair around sores and don't leave the hair wet with the medicine for the goat to lick.

* * *

Fleas on Dog.

How can I remove fleas from collie dog?—X., Dinuba.

Wash thoroughly with a solution of eucamphol and water, 1 to 200; sprinkle his bed with the same.

* * *

Polypus.

What is good to cure polypus in a cow's nose? Is there any cure?—Desert Farmer, El Centro.

The polypus may be a simple abcess containing pus, a tumor or actinomycosis. If the first, and it is where you can get at it, cut it open, making a free incision across the full width of the enlargement. If a tumor, you will have to call on an experienced veterinarian. If actinmacosis, it will need internal treatment of iodide of potash one pound, water sufficient to make a quart when dissolved. Give one-half ounce night and morning in a pint of water. My advise is to call upon a competent veterinarian to make a diagnosis for you. You have one in the newly appointed County Stock Inspector for Imperial county.

Keeping Sweet Potatoes.

Please tell me how to store and keep sweet potatoes?—O.

I have had perfect success in keeping sweet potatoes by storing them in perfectly dry sand in a barn on the ground floor. I made a bin on the floor by setting up a 12-inch board parallel with the foundation wall, and four feet from it and as long as required to hold what I wished to store. I placed dry sand on the bottom to the depth of about four inches and then began at one end and placed the potatoes in the bin as closely as I could pack them, being careful not to pack higher than winthin about three inches of the top of the bin. When all had been put in I poured dry sand over them until every space between the potatoes was filled, and kept adding sand until the whole bin was covered to the top of the board. Two or three weeks later a layer of sacks was put over the top of the sand. When opened up in the spring not a single decayed potato was found.

But I dug them very carefully in the fall and handled them as carefully as eggs, allowing them to lie in the sun to get thoroughly dry, a couple of days, covering over at night with sacks. Only perfect specimens were packed away, as I never use for seed anything but the best and most perfect type of its kind. If this inquirer had in mind keeping sweet potatoes

The Celebrated DeLoach Mill
The World's Standard for 20 Years
Saw Your Own Lumber
For lumber is lumber nowadays, and you can do it better than the other fellow, with our help.
We Set the Pace —Others do the Best They Can
A 15-year-old boy can operate successfully. Two hands cut 5,000 feet per day. 15,000 mills in use the world over. Box 12 Fresno, California, USA

on a larger scale for sale in the late winter or early spring market, I think he will be disappointed in results.

The consensus of opinion among growers is that the loss from shrinkage and decay is almost always greater than any advance in price. Better sell the crop as early as it can be marketed and allow the other fellow to take the risk. There are many different methods of keeping sweet potatoes until spring. I knew a very successful grower in El Cajon valley, who dug and dried the potatoes with care and packed them in the sweat boxes used for sweating raisins, and piled the boxes one on top of the other in a shed adjoining his barn, where they kept without loss worth mentioning until spring. One of the essentials is to keep them dry, and another is to handle carefullly.—Q. A. L.

Onion Sets.

Please inform me through the columns of your paper when is the best time to sow onion seed for the purpose of growing sets to be set out next winter.—W. F. R., Lenore.

March and April are the best months to sow onion seeds for sets. But I would caution any one without experience to attempt it on a large scale. The best sets are grown upon lands that do not require irrigation, and sets grown upon such soil keep much better than where irrigation is necessary. It must not be ininferred that when grown without irrigation I mean without plenty of moisture, but upon soils in which the water is near enough to the surface to rise by capillary attraction and keep the ground damp enough for the needs of the crop without irrigation. If the inquirer has very mellow loam or sandy soil he might begin on a moderate scale. It takes about 300 pounds of sets to plant an acre or about five pounds of seed.—Q. A. L.

Planting Corn.

When is the best time to plant field corn and what is best seed to plant? E. L. S., Morgan Hill.

It is impossible to answer the first question definitely, because locality and season controls. For instance, near Los Angeles last year, cold rains prevented planting till middle of April. Ordinarily, planting begins in March. If your section is liable to late frosts, you can learn by inquiry, and plant accordingly. In any case, the ground must be well warmed up before seed will start.

As to variety, your neighbors have probably found the most desirable kinds, but Yellow Dent, Wisconsin White Dent, Stanford White Flint, King Phillip and others are good.

Write seed houses advertising in Cultivator and ask for seed catalogues, which will give you full description of varieties.

Grapes and Peaches.

What is most profitable table grape for this section? Also for quick return. Are peaches superior to grapes? If so, what kind? Will Nebraska-grown trees do well here?—M. H. S., Morgan Hill.

See Mr. Mills' answers to queries in former Cultivators. Also see article on page 188, issue of Feb. 20. However, a fund of information of your own local conditions and adaptability of soil and climate, may be had of your local nurserymen and fruit growers. If your conditions favor grapes, they would yield quickest returns. Nebraska-grown trees, if true to name and free from disease and pests, will be all right, but coast-grown trees are usually preferred.

Grafting Grapes.

We have some Sultanas growing amongst our acreage of Muscats (four years old). Would you recommend budding or replanting? When is the best time to bud and what is the procedure?—J. C. W.

Graft the vines two inches below the surface, using a two bud scion. In two years they will be about as large as your other vines, while if you dig them out and replace, they never will catch up.

Replanting Apple Trees.

I have two acres and one-half of apple trees. I want to move them to another place. The trees were planted two years this month. How much must I cut back from the top and how much from the roots?—U. C., Greenfield.

Cut the tops back to about four branches, leaving them eighteen inches long. Cut the roots so that they will go into a hole that is three feet deep and wide. Now is the time to do it.

Army Worms.

As I remember, Mr. Mills in his articles last year, said that the great damage done in citrus orchards by army worms may be largely prevented by plowing under of the green manure crops in the orchard, before breeding and feeding time comes. How late can I leave my crop before plowing, that is, when is earliest hatch of the worms?—M. O. R., Pomona.

Plow your orchards now. It is the best time, considering all things, for it gives time in which to get the land in good shape before the rains stop.

Mare in Heat.

The following with some other queries were sent to Dr. W. J. Oliver before he died, but which he was unable to answer and later sent to Mrs. Sherman, which accounts for long delay in answer.

I have a mare 12 years old that is in heat practically all the time, sweats greatly upon the slightest exertion either on road or in field, and at night cold perspiration stands out all over her, especially on the hind quarters, which are as wet as if a pail of cold water had been thrown on her, while the ears, nose, legs, and in fact, entire body gets icy cold. She is a blooded animal, well cared for, fed regularly, has good appetite and seems to be in perfect health generally, although at times she bloats a very little, has some gas and intestines rumble. Reluctantly, and without results, I have had her served five times at intervals of eighteen days, which seemed to only augment her heat, and between each service she would pace to and fro in her yard almost constantly and cause no end of trouble when at work. Kindly advise fully in this case and oblige.—"A. B. S."

Take this mare to a good horse doctor and have her treated for internal inflammation. She should not be bred as it only aggarvates the trouble. She is no doubt suffering from some form of irritation, and it is not safe to drive her no matter how gentle she has always been.

Peanuts.

Will you kindly tell me the proper time to put out or plant peanuts in this section of the country? Do the blossoms require covering with dirt, and should they be left to bury themselves and the plant cultivated as other vegetables are? Also tell me whether they require much irrigation. —Harry Burton, Chino.

For instructions in planting peanuts see Mr. Lobingier's article on page 75 of number of January 16. It is not necessary to cover blossoms, but the soil must be light and friable.

Gum Disease.

I have a number of orange trees in my grove affected by gum disease and the trouble appears to be spreading. Can you advise me what remedy to apply to cure the disease? Also the cause of the disease and method to prevent its spread.—Subscriber.

See Cultivator of Jan. 9, page 51, for article by Ralph E. Smith on gum disease, also short item by S. A. Pease on page 108 of Jan. 30. Those articles treat it much more fully than can be given in these columns. It is not infectious but is constitutional and requires soil treatment. It is also best to remove diseased tissue, apply wax. Lighten and get air into your soil.

Seedless Blackberries.

I once saw advertised in California Cultivator some seedless blackberries, but the paper got lost. Will you please tell me where I can get them. Would like to plant them this spring.—Mrs. Jacob Sturm, Porterville.

Chas. C. Navlet Co., Inc., of First and San Fernando Sts., San Jose, sell the seedless blackberry.

Fertilizer.

As one of your subscribers I write you for information on fertilization of soils for our ground of sandy loam nature. We seem to have a fine soil for general truck purposes, but there seems to be something needed. I am now interested in potatoes but would like, if possible, to either through your office or the State department a booklet, if there is such a general information for different crops, a general fertilizer, etc. It seems to me we should be able to make this fertilizing material instead of paying some dealer a high price for very little fertilizer and remainder of something else. I would also like to know how and when and how much to apply, etc. If you can give this information or direct me where I can receive it.—L. B. D., Burbank.

The Department of Agriculture, Washington, D. C., will send you on application, bulletins on fertilizers. There are also a number of good books on manures. Also a most excellent book to give a better understanding of soils and needs, is Hilgard's "Soils" by McMillan Co., N. Y. "Soil" by King; "Fertilizers" by Voorhees; "Chemistry in Some of Its Relations to Agriculture" and others are good along the same line.

The making of your own fertilizers, except by the compost or manure pile or by green manuring, will probably not be satisfactory. You may, however, apply the various elements separately. But bear in mind, that the three principal elements which are needed are a staple in the market and the price varies but little. Of course, if you get a complete fertilizer, so-called, but largely "filler" you get bilked. But there is little opportunity for that these days, and we believe most of our fertilizer manufacturers are delivering honest goods. The "when, how much," etc., depends upon your crop.

Fertilizer in Corral.

When a corral is rented for stock on a piece of land, to whom does the manure belong? Is it to the owner of the land or owner of the stock? What is the law and costume in California?—S. D. H.

In the corral or thrown up in piles, it is personal property and belongs to owner of stock. Once scattered, it is "real estate" and belongs to the land.

General Agriculture

THE POSTMASTER-GENERAL ON PARCELS POST.

THE present general parcel post rate is 16 cents a pound for people in our own country, the limit of weight being 4 pounds; while the rate from the United States to 29 foreign countries is 12 cents a pound and the limit of weight to 24 of these countries is 11 pounds. In order to have the rate consistent and equitable, the department has recommended that on packages for delivery in this country, it shall be the same as those sent abroad, namely, 12 cents a pound, a reduction of 4 cents, and the weight limit 11 pounds, an increase of 7 pounds; for one ounce, 1 cent; over one ounce and not exceeding 3 ounces, 2 cents; over three and not exceeding four ounces, 3 cents; over four and not exceeding five ounces, 4 cents; over five and not exceeding six ounces, 5 cents; over six and not exceeding eight ounces, 6 cents; over eight and not exceeding twelve ounces, 9 cents; over twelve ounces and not exceeding one pound, 12 cents.

In my annual report I also recommended a local parcel post on rural routes, at the rate of 5 cents for the first pound and 2 cents for each additional pound or fractional part of an additional pound up to 11 pounds; for two ounces or less, 1 cent; over two and up to four ounces, 2 cents; over four and up to eight ounces, 3 cents; over eight and up to twelve ounces, 4 cents, over twelve ounces and up to one pound, 5 cents. The object of this recommendation is to enable the local merchants to hold and increase their trade on the rural routes, to give to the farmers and patrons of these routes the accommodations which the machinery of the rural service, utilized to a greater extent than at present, will permit.

It is the intention to frame a bill in such form that parcels carried at this special rate will be limited to those received upon a rural route or at the distributing postoffice thereof, 'and delivered by rural carriers upon the same rural route or another emanating from the said distributing postoffice. According to the department's proposition a mail order house shipping goods by freight will not be permitted to distribute them by the special parcel post on rural routes.

It is possible to offer this low rate for a special local rural parcel post for the reason that, there being no railroad transportation, its operation would involve no additional expense. The necessary machinery is already in existence. There are 38,215 rural routes in operation, supplying about fifteen millions of people, and even at the rate proposed it would require only three packages of the maximum weight to be taken out each trip over these routes in order to wipe out the deficit of the postal service. The increased cancellations would raise the salary of postmasters of the fourth class and the establishment of this service would finally be instrumental in making the rural routes self-sustaining. The rural service will, in all probability, cost the government this year $34,000,000, an increase of $10,000,000 over last year, and yet the benefits derived therefrom cannot be measured in dollars and cents.. A local parcel post on these rural routes would be of incalculable benefit to the patrons of the routes as well as to the local merchants. It would tend in time to bring about the improvement of the roads througout the country, thus adding to the valuation of the farms with increased accomodations afforded by the service and better roads.

The statement has been made that this special rate on rural routes would be the entering wedge for similar rates on the general parcel post. That is impossible, for in the case of the general parcel post transportation by railroads is a factor—about $45,000,000 were paid last year for mail transportation and $6,000,000 for postal cars—which adds very largely to the cost of the service, while there would be no railroad charges or other additional expenses connected with the local rural parcel post, as the rural delivery is already thoroughly equipped and in operation.

In some quarters it has been claimed that the large mail order houses would, under the proposed law, utilize the special parcel post on rural routes through agents. Mention has already been made of the intention to recommend a provision which will prevent such use of the routes. It should also be borne in mind that even in the absence of such a prohibition any systematic attempt upon the part of a mail order house to thus deliver its wares would necessitate the employment of many thousands of local representatives. Their catalogues show pretty plainly that they attribute a large measure of their success to their remarkable low selling expense, and that the absence of any sort of agents is the principal feature of their argument in accounting for the supposedly low prices of their goods.

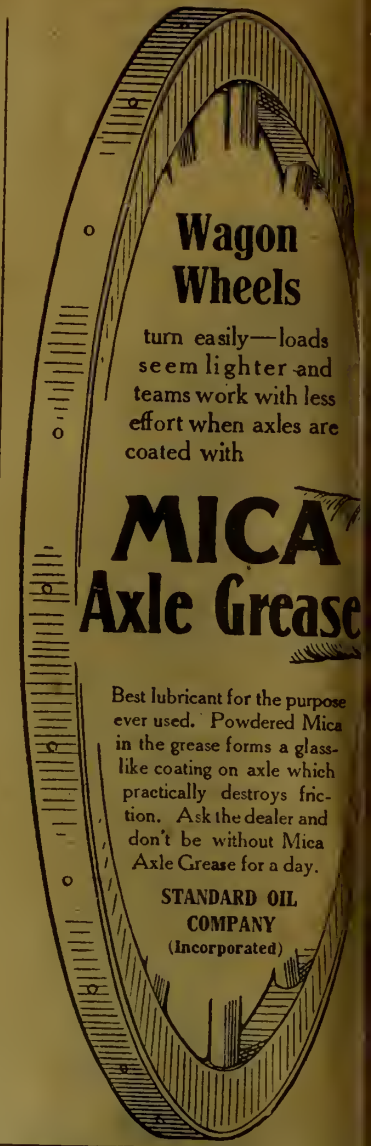
THE PARCELS-POST STRUGGLE.

Here is what President Roosevelt had to say with regard to the proposal to establish a parcels post service in the United States:

I commend to the Congress the consideration of the Postmaster-General's recommendation for an extension of the parcels post, especially on the rural routes. There are now 38,215 rural routes serving nearly 15,000,000 people who do not have the advantages of the inhabitants of cities in obtaining their supplies. These recommendations have been drawn up to benefit the farmer and the country storekeeper. Otherwise I should not favor them, for I believe it is a good policy for our government to do everything possible to aid the small town and the coutry district. It is desirable that the country merchant be not crushed out.

In spite of the kindly sentiments expressed in the foregoing paragraph a tremendous agitation has been developed against this modest effort to make life more pleasant for the farming population. Offices are being maintained in the principal cities of the country to combat parcels post. It will be remembered, however, that an equally fierce agitation was maintained against free rural delivery; but in the end the farmers won. They can win parcels post, too, if they will only make up their minds to have it.

All sorts of wild and unreasonable statements are being printed, and the mails flooded with them, inflaming against the Postmaster-General's idea.



Wagon Wheels

turn easily—loads seem lighter and teams work with less effort when axles are coated with

MICA Axle Grease

Best lubricant for the purpose ever used. Powdered Mica in the grease forms a glass-like coating on axle which practically destroys friction. Ask the dealer and don't be without Mica Axle Grease for a day.

ESTIGATION OF OUR NEEDS.

)llowing the efforts made by the fornia Promotion Committee and River and Drainage Association of fornia, through the California gressional delegation at Washing- a committee of United States neers, consisting of Colonel Dan- W. Lockwood, Lieutenant-Colonel th S. Leach and Captain A. H. er of the U. S. Board of Engin- for Rivers and Harbors, visited fornia during January for the pose of making a personal investi- on of conditions relating to the or of San Pedro, the harbor of ka and the San Joaquin river l Stockton to its mouth, and the amento river from the mouth of Feather river to Suisin Bay.

lis investigation was in pursuance n act of congress calling for infor- ion regarding certain projects ad- ted by the local United States en- ers, Lieutenant Colonel John lle, Major C. H. McKinstry, Cap- Thomas H. Jackson and Captain s A. Fries. The committee was authorized to make other investi- ons than that above enumerated.

t Stockton a meeting was held re the River Improvement and inage Association of California ented a voluminous document wing the needs of all the rivers of State. This document was filed the engineers, and then the needs he San Joaquin river were shown statistics and oral addresses from nbers of the Chamber of Com- ce. Following this meeting the mittee of engineers was taken n the San Joaquin river to its ith and then up the Sacramento r to the mouth of the Feather river, making personal investigations of conditions.

At Sacramento a public meeting was held and the needs of the Sacramento river fully explained.

Two projects are before the United States engineers relating to the two rivers, these being the deepening of th channel of the San Joaquin to give a fifteen-foot channel from the city of Stockton to the bay and the other the deepening of the channel of the Sacramento to fifteen feet from the city of Sacramento to the bay, and the deepening of the Sacramento river to nine feet from Sacramento to the mouth of the Feather river.

The investigation of the harbor of Eureka was held at the California Building in San Francisco, where representatives from Eureka assembled to give data and statistics.

This visit of the engineers means much for California, for it has given prominent members of the board a personal knowledge of conditions which will, undoubtedly, be of benefit to the State when future projects come up.

BEET SUGAR CROP OF EUROPE.

As the result of its latest investigation, under date of December 14, the International Statistical Sugar Association estimates the 1907-08 crop of beet sugar in the principal countries of Europe at 6,189,880 tons of 2240 pounds, against 6,446,306 tons produced last season. A decrease in production is shown for all the countries mentioned save Austria-Hungary and Italy. In the latter the output for the current season is estimated to be 21.8 per cent larger than that of last season and in Austria-Hungary 6.5 per cent larger.

COLORADO STATE FAIR.

Colorado is to have an industrial exposition worthy the productions of the State and for the exhibition of its resources. The first annual exposition will be held September 7 to 12, 1908, under the management of the Colorado Industrial Exposition Association at Overland Park, Denver, which is being converted into one of the most extensive and complete fair grounds in the country at an expenditure of $150,000.

Colorado stands at the head of all States in the production of sugar beets. Her factories last year bought the product from 50,000 acres; Michigan came next with 40,000; Nebraska, 20,000 and Utah, 15,000 acres. The average price paid was about $5 per ton.

A contented mind is the greatest blessing a man can enjoy in this world; and if in the present life his happiness arises from the subduing of his desires, it will arise in the next from the gratification of them.—Addison.

ARBOR DAY.

It would be a blessing to California if Arbor Day were universally observed. It would add untold thousands to the wealth of the State if millions of timber trees were planted each year, cultivated and grown into forests for commercial use in the future. Our hillsides should be our timber domains, preserving the lands from washes and our foothill towns from disaster by floods.

There is more than sentiment in this Arbor day feature inaugurated by J. Sterling Morton. There is a pecuniary profit to be realized from it. Our forests have been cut away for industrial development until we are on the verge of bankruptcy so far as the future supply of timber is concerned. The high price of lumber is not wholly due to the greed of the lumberman. It comes in part from the poverty of our timber domain. Our national foresters have been warning us that we are approaching a most serious condition with our timber supply, but up to recent years we have given no heed to their appeals. We probably would not be interested enough to wake up to our situation at all were we not forced to do so by the high prices of lumber and the prospect of total loss of our timber in a very few years.

It is high time we are getting busy. Every State in this Union ought to be planting millions of trees and taking care of them when planted.

There is some appearance of awakened interest, however, as manifested in the congresses held the past five years. The Irrigation Congress, recently held at Sacramento, was largely attended, and representatives of the government at Washington, and from the timber states, were earnest in their efforts to secure co-operation between the different agencies of the country for systematic tree planting and forest protection. To this meeting Secretary Wilson wrote as follows: "The nation is awakening to the necessity of planting trees and making the most of those that are mature. Our institutions of learning are taking up the study of forestry. State societies are inquiring. The experiment stations of the several States and Territories are making research. The Department of Agriculture is training a bureau of forest experts in woodcraft to serve the Nation, the States, companies and individuals along forestry lines."

This is encouraging information, but the work should not stop with the efforts of the government. Our farmers, especially those in California, ought to plant for fuel, and for the protection of their lands. Cities and towns ought to plant ornamental trees for beauty and comfort.

Civic societies everywhere should take this occasion, the festival of March 7, to teach by precept and example, the beneficial influences on the character of the community which emanate from well cared for trees and lawns. It is to be hoped a very general observance of Arbor Day will be given by Californians this year, and every recuring year, until our waste places are made bowers of beauty and usefulness.

THE GRANGE.

Co-operation is the generic principle of the farmer organization known as the Grange. Upon this doctrine of mutual help rests the future prosperity of the agricultural classes. The wise farmer has learned long ago that he can not isolate himself and do anything, he must work for a common interest, in a common cause, or fight his battle alone, which is a hard proposition to overcome. If, however, he contributes his influence to an association of his co-laborers, his chances of success are in the proportion of the strength of the organization to which he belongs.

The great need of the farmer today is organization. The Cultivator has said this time and again, and has endeavored to point out the inestimable advantage of a thorough and systematic co-operation along all lines of agricultural labor. If any argument were needed in support of our contention, it may be found in the California Fruit Growers' Exchange, an organization that for years has met with marked success along the line of co-operative endeavor. In this connection, as an exponent of this doctrine of farmers' co-operation, we quote from Farm and Ranch, an agricultural publication which is earnestly advocating farmers' organization along the lines of the National Grange. We quote:

> "Organize as students of the economic, civil and commercial systems of our day in order that we may learn to play our part with credit to ourselves and honor to the country. This is no time for hesitation and doubt. He who hesitates is lost and will carry others down with him. The home and the family, the farm and the country are at stake in the present great moral and industrial warfare against the entrenched powers of speculation, graft, greed, selfishness, commercial piracy and the octopus that feeds on the life-blood of women and children as well as the flesh of men. It will require all the forces of education and co-operation, of justice, equity, and morality to win the fight for a fair living to those who dig in nature's storehouse of wealth—the soil."

CLIMATE AS AN INDUSTRIAL ASSET.

An Eastern civil engineer who spent considerable time in California, looking into the mechanical possibilities of a very large industrial proposition, has given out some interesting data bearing on the future of this State in a manufacturing way. His conclusions are based on climate as an asset to industrial expansion.

He takes the report of the last census as the basis of his conclusions, together with his study of conditions as he found them while in California. The gross product per operative is said to represent value as follows: In the United States at large, $1900; in Connecticut, as a fair example of an eastern State, $1997; in California, $3328. The great preponderance in favor of California this engineer attributes to climate. Estimates were based on coal as fuel in both cases, but California now finds oil cheaper than minous coal at eastern prices.

It may not be entirely fair to attribute a the difference in cost of manufacturing t mate, because California furnishes such an of raw material used in structural work, t is a little difficult to strike a just mean be what we furnish of our own resources, and climate does for us. Suffice it to say, our climate enables the workingman to do more given day's work than he can do in the weather of the East or the Middle West. I respect climate is to be regarded as a f Then there is another feature to the propos heat, power, light and ventilation cost mo the East than here, because of climatic i larities. They become fixed charges in indu operations and must be so considered in pla any manufacturing business. Not only do and power effect machinery, but they effect greater the men behind the machine.

There is no State in the Union where the laborer suffers so little from extremes of and cold as in California, for here we have n tremes of temperature. Human energy is debilitated by biting cold nor suffocating Winter and summer are so nearly akin in mate conditions the workingman toils on, day to day, in a condition of physical vigor w renders him capable for work all the year ro

These considerations have produced an u pected inquiry among eastern manufacturers see in California, a future serious compet not heretofore taken into consideration.

ABOUT SMALL INVESTMENTS.

We have been deeply interested in ing one of Charles G. Davis' (late Comptrole the Currency) articles in the Saturday Pos "Why the Small Investor Loses." He takes position, and we believe wisely, that in the majority of cases moderate sums of money not be invested safely so as to bring in n than a reasonable interest return and should be invested in response to specious newsp advertisements." Again, small investors are the wrong side of the market, being buyers seller having all the advantage of inside kn edge and future possibilities for success of proposition he is selling. "In the majority proffers of mining and plantation stock thro newspapers, says Mr. Davis, the man who b is paying a profit fixed by the seller for his benefit.

> "Large capital makes a preliminary inves tion at its own expense. The small inv either acts upon no investigation, or upon a vestigation paid for by the seller. Large ca negotiates for a price with the true value mind. The small investor generally buys wi out knowledge of the real value.
>
> "What chance has the small investor? knows nothing as to whether the promotors men of past business success. Many men are known business failures in their own com nities are often long-distance millionaires. O they are broken plungers whose brief success widely chronicled, but whose gradual busines lapse has naturally not been heralded."

Too often investors are inveigled into bu stocks by the names of the promotors of proposition. This is a mistake. Names do count for much in a selling scheme, for, as a eral thing, promotors are not over careful ab the representations they make, and it is often ficult to understand just what they do intend mean by what they say. If one has no means finding out the exact situation for himself. he best let all mining and other get-rich-qu schmes alone. This advice is particularly dir ed to the farmer, whose large profits in the p few years have given him a good deal of surpl money to invest, a thing the sharp seller of bon and stocks has learned and which he is seeki to take advantage of.

A Washington farmer has just been granted divorce, because his wife went through his poc ets and took all his money. He had taken it o of the bank for fear the bank might break. Wel his wife broke him all right. Moral: The ban in this instance was safer than the wife.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yar

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

LINE BREEDING.

WE HAVE been asked for a practical talk on line breeding and how far it can be carried without injury to the flock.

Line breeding in our opinion (and we speak after ten years' experience) can be followed indefinitely without injury to your flock. In fact, we believe with proper selection and care with the blood lines that the size, vigor and health of the flock will not only be maintained but built up.

We find that many do not understand the difference between line breeding and inbreeding.

We all know that thoroughbred poultry, and even live stock, was inbred before a variety or family was produced. Inbreeding can be practiced in a flock of fowls without injury if done with care. We have known many people that would not use a cockerel from a pen of birds, because he was related, never stopping to think that if you have twelve females in a pen that only one is directly related to the cockerel, and if a trap nest is used and a record kept of chicks you can take out the mother of this bird. I wonder how many have ever figured out how many combinations we can make with a pen of twelve females and one male and not inbreed close enough to be harmful. Our advice is always the same when we talk with those breeding thoroughbred poultry. If you are breeding a certain strain and want new blood, get of some one that is breeding the same strain. If you buy a pen or eggs from a breeder and need a cockerel to mate with your birds buy of the same party. Do not introduce an out-cross and expect good results. The first year you may undo all you or some one else has done for years, by judicious line breeding.

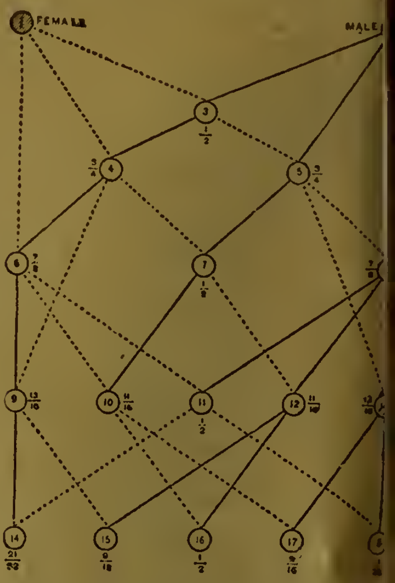
I knew a flock of bantams to be inbred for years, yet this flock is strong and vigorous, and in spite of the fact that they have been inbred, many of them each year are over weight.

We know of another flock of line bred White Leghorns, where no new blood has been introduced for over 15 years, and still another, where the owner wants to add vigor to his flock, selects eggs from hens that he wishes to raise cockerels for next season's breeders. He sends these eggs to another State, has them hatched and raised under different climatic conditions, and feed. Then when they are fully matured has them returned to him. He selected the ones that suited him best and mated them right back into his flock with good results.

We tried this once for several years on a flock of Indian games, and bred father to daughter and son to mother without loss of vigor, yet we eliminated some disagreeable features that had bothered us for a long time. In fact, we never had what we considered proper color that would reproduce itself to a marked degree, until we did inbreed.

After we had established a strain approaching our ideal, we carefully line bred, being very careful not to out-cross.

We produce herewith Mr. Felch's breeding chart and its explanatio



Female No. 1 mated with male No. produced group No. 3, which is one-ha the blood of sire and dam.

Females from group No. 3 mated bac to their sire No. 2, have produced grou No. 5, which is three-fourths of the bloc of the sire, No. 2, and one-fourth th blood of the dam, No. 1.

A male from group No. 3, mated bac to his own dam, No. 1, produced grou No. 4, which is three-fourths of t blood of the dam, No. 1, and one-fourt the blood of the sire, No. 2.

Again we select a cockerel from gro No. 5 and a pullet from group 4, or vi versa, which will produce group 7, whic is mathematically half the blood of ea of the original pair, No. 1 and No. This is the second step towards produ ing a new strain.

Females from No. 5 mated back to t original male, No. 2, produced group that are seven-eights the blood of No. and a cockerel from No. 4, mated b to the original dam, No. 1, produ group No. 6, that is seven-eights blood of the original dam, and only o eighth the blood of the original sire.

Again we select a male from No. 8 females from No. 6 and for a third produce chicks (in group No. 11) that half the blood of the original pair. T is the third step, and the ninth mat in securing complete breeding of our n strain. In all this we have not broke a line of sires, for every one has co from a group in which the preponderan of blood was that of the original s Nos. 2, 8, 13 and 18 are virtually t blood of No. 2.

We have reached a point where would establish a male line whose blo is virtually that of our original dam, a we now select from No. 6 a male whi we mate with a female from No. 4 produce group 9, which is thirteen-s teenths the blood of the original dam N 1 and three-sixteenths the blood of original sire.

Again we select a male from No. 9 a a female of the new strain No. 1 a produce group 14, which becomes 21- of the blood of the original dam, t preserving her strain of blood.

A male from No. 13, which is thirte sixteenths the blood of the original s No. 2, mated to females from No. which are five-sixteenths the blood of t original sire, No. 2, we have three d which is nine-sixteenths the blood said sire.

While in No. 16 we have the n strain and in No. 18 the strain of o original sire, No. 2, gives us group tinct strains, and by and by with systematic use we can go on bree for all time to come. Remember each dotted line is a female sele and each solid line the male selecti

different pens. I would be much obliged if you could tell me what to do and the cause. We much appreciate the Cultivator, especially the poultry items.—Fred Pope, Orange.

Your chickens have chicken pox. Clean up your pens, whitewash your houses and runs. For relief, anoint the afflicted parts well with carbolated vaseline.

For a complete description and treatment see Cultivator of September 19, page 280.

* * *

Trim the Spurs.

Will you please tell me what caused some of my chickens to have large sores upon their bodies resembling somewhat a laceration, but that could not be possible as my chickens are in well fenced lots, debarring dogs and coyotes. I cleansed the sores and applied healing salves, and the chickens eat well until a very short time before they die. From the time I discovered the sores until the chicken died was about ten days.—M. F. C., Santa Ana.

We think the trouble is caused by the spurs on male bird; we know of nothing else that could cause the trouble. If your male has spurs, cut them off and see if this don't stop trouble. We have known some fine birds to be ruined by neglecting to trim rooster's spurs.

* * *

Liver Trouble.

Seeing that you give advice on diseased chickens, I hope that you can help me with my chickens. Their trouble is the bowels begin to move very loose, and the discharge is between a yellow and green. Then they began to droop and will not eat for a long time before they die.—H. W., Artesia.

Your birds have liver trouble. We would give a complete change of diet. As you don't say what you are feeding, it is hard to recommend a diet for them. All we can do is to advise a complete change.

* * *

Who Can Beat it?

Thinking the readers of the chicken department in the "Cultivator" would be interested in a "Rhode Island Red" laying record. I give the following: I have a pen of seven Rhode Island Reds, six pullets and one hen. Pullets are nine months old, and they have laid seven eggs one day and six the next, for every day since Dec. 10th, and the end not in sight. This, I think, is very good for a new beginner in the chicken business.—A. T. Kenyon, Charter Oak.

Who can beat this? Mr. Kenyon's record is a good one, as many birds don't lay so regular through December and January. Can any one equal this?

* * *

Softshells.

Can you tell me any remedy for a hen that lays soft shelled eggs every day? She is supplied with shells and grit, has a large run, is fed on wheat, skimmed milk, sweet, and sometimes a mash of cornmeal mixed with milk and a little salt. Please answer through the Cultivator.—A Subscriber, Chula Vista.

Generally, when a hen lays soft shelled eggs they are too fat. You are feeding a fattening diet. Cut out cornmeal and milk and feed plenty of lime, oyster shell and grit. If you have a litter in which to feed grain and make the hens work for what they get will reduce the fat and no doubt will remove the trouble.

* * *

Feed for Young Turkeys.

What is best feed for young turkeys?—I.

For first ten days feed hard boiled eggs chopped fine, shell included, mixed with light bread softened with water, (or better sweet milk;) this should be squeezed dry before mixing with egg. After they are about ten days old gradually add a little

* * *

Feed for Pigeons.

What is the best feed to give pigeons to make their eggs fertile? Also what is the cause of infertile eggs?—E. G. S., Morganhill.

There are several causes for infertile eggs in pigeons. Your birds may be too fat, which is caused by feeding highly stimulating food. Another cause is lack of stamina in cock bird, or perhaps your birds won't mate. If you are sure your birds have mated cut off about half of cock bird's tail. Feed wheat and Kaffir corn. We know of some pigeon men who only feed wheat, yet have good success.

* * *

Chicken Pox.

Will you kindly tell "an Easterner" what is the matter with her chickens. They were all right and growing fine until the recent rains; then their eyes all swelled up, one has a lump on its eye as big as a medium-sized marble. Great lumps or warts came in their bills and they drooped and died, although dosed with red pepper tea and their heads rubbed with lard and pulverized alum. What is good for the chicken chicken pox? I know what to do for the other kind.

For chicken pox we quote from Dr. Sanborn, a recognized authority on poultry diseases:

The prominent symptom of chicken pox is the sore and scab on comb and wattles. Sometimes they appear only on the eyelids. Unless the bird has been exposed to cold and wet there may be little signs of general illness. Appetite may be good, the bird lively, but those pox marks on the head tell the story. After you have once seen a case you are not likely to mistake the disease. I write of the cases where the eruption shows only on the edges of the eyelids because of the experience of one of the large New England plants two years ago. Disease appeared in several of the large flocks, the only symptom being the pox marks on the eyelids. Quite a number of the hens died; the disease was spreading to pen after pen, and yet they did not know the trouble on hand. Two hens were sent to me by express and, on examination at my station, I reported: "Chicken pox." The two hens were at once sent back to the farm, one being dead when they arrived. Soon there were plenty of cases with pox marks all over the comb and wattles and my diagnosis was found correct.

Chicken pox cases need special care lest they take "cold." Sick birds should be housed, protected from drafts, and given pure air to breathe. Exposure to wind or storm nearly always adds catarrh, roup or canker. Either of these added to chicken pox makes the case a serious one. Most cases where there is the combination of roup and chicken pox finally die. It is almost surely fatal to allow a chicken pox hen to run out in the cold rains of fall or winter.

Simple chicken pox needs little drugging except to get all the calcium sulphide possible into the birds. Calcium sulphide is a heavy, dry, bad smelling powder, and can usually be bought in four ounce bottles for twenty-five to forty cents. A little of the top of the contents of the bottle may be thrown away, if it is dryer than the rest of the drug. One heaping teaspoonful of the heavy powder can be mixed with four quarts of wet mash and fed freely to all ill birds once a day. This should be kept up as long

ess in the poultry business be-
of the lack of experience. As a
men who have made any busi-
a success have started with
ted means, and step by step
ked their way to fame and for-

r years I have been an admirer
White Pekin ducks, and finally de-
l that I would give the subject a trial. I secured the best stock I could get, viz., the Rankin strain of the Mammoth White Pekins, my start being eleven very large eggs which I placed under a large Plymouth Rock. At the proper time I got eight very hardy, thifty young ducks which developed into splendid specimens of their kind. I retained three ducks and a drake, selling the others for $1 each at four months old. After they were grown I was greatly surprised to find what a small amount of feed they consumed, when I had always heard that they were such ravenous eaters. I gave them good conditions and was surprised to find them beginning to lay when seven and one-half months old, and when just a year old they had averaged just 100 eggs for each duck, and when thirteen months old they had each produced 122 eggs. During the month of May they laid 42 eggs in fourteen consecutive days, and at another time 16 eggs on five days consecutively. I have sold over $20 worth of eggs for hatching without advertising any beside the eggs that were used for eating. I have raised a flock of 25 splendid young ducks and have not lost one by weakness or disease.

I have learned that by care and proper feed we can get results far beyond our expectations, if we get in real earnest, go careful and do not use slipshod methods in our treatment of profitable fowls.—Farm Stock Journal.

SOME POULTRY TERMS.

A cockerel is a male bird less than a year old.

A cock is a male bird over a year old.

A pullet is a female bird less than a year old.

A hen is a female bird over a year old.

A yearling is generally one counted as having laid twelve months.

A sitting of eggs is thirteen, although many poultrymen have increased it to fifteen.

A broiler is a bird weighing two pounds or less, and from six to twelve weeks old.

A spring chicken is a young bird weighing over two pounds.

A capon is the male bird deprived of its generative organs for the purpose of improving the weight and delicacy of its carcass.

A stewing chicken weighs about three pounds.

A roaster weighs four or more pounds.

A poult is a turkey in its first year.

A poularde is a pullet deprived of the power of producing eggs, with the object of great size.

A trio is a male and two females.

A breeding pen is generally made up of from six to fourteen females and a male.

The male chick is called a cock, the male goose a gander, the male duck a drake and the male turkey a tom.

The Success (no lamp) Incubator Company, White Salmon, Wash.

TRANSFER OF STOCK.

This is to certify that I have sold all my Columbian Wyandottes, fixtures and good will to Bloom and Vandergood of Glendora, Cal. In this transfer Mesrs. Bloom and Vandergood get one of the best flock of Columbians on the Coast, as the sale included all of my prize winners. The above firm are painstaking, careful breeders and business men, and I know that the Columbians are in good hands and that no expense or trouble will be spared in keeping this flock in advance of any on the Coast.—Ed. M. Burnell.

Starbuck's Barred Plymouth Rocks
We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are layingfine. We have divided into pens according to the way they are showing up in six months laying. $2.50 for 13 eggs from first pen. $1.00 from 2nd. until they have time to make longer records. (Except from our one best, not for sale. We claim the world's Barred Rock, 6 months laying record for this one.) Do you wish to hear about our prize winning Buff Orpingtons and Silver Wyandottes? We have something to crow about. No Sunday sales or visitors. Wm Starbuck & Son. Fullerton

Browning of Ogden, Utah.
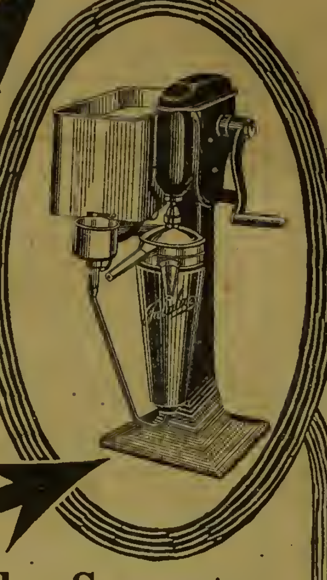
Mission View Poultry Ranch Mrs. C. D. Hubbard San Fernando, Cal.

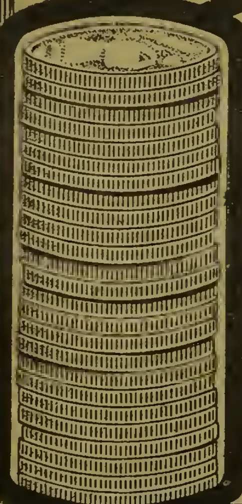
CREAM PROFITS

If you are selling your whole milk to the Creamery you are not getting as much profit from your cows as you should. In fact you are losing 50 per cent. Without increasing your feed bills one penny or milking another cow you can double your cream profits. This is demonstrated by thousands of dairymen and farmers every day in the year.

The Sharples



Tubular Separator



gets all the cream in the milk—it skims out every cent of profit, so that you can turn it into cash. Here's one letter that tells the story of how to double your cream profits:

Union Mills, Ind.
GENTLEMEN:—We have a Sharples Tubular. Before we bought it, we had been selling our milk to a creamery at Union Mills, getting not more than $8.00 a month, but **since we have the Tubular, we have been getting twice more,** and are so satisfied with the Tubular.
MRS. JOHN C. MILLER

Such proof as this ought to convince you that a **"Tubular"** will be a money-maker for you. The extra profit will soon pay for the separator while it will keep right on earning these big profits for years. Write today for our new catalog and **free** copy of that valuable book, **"Business Dairying."** Ask for book No. 260.

THE SHARPLES SEPARATOR CO.,
West Chester, Pa. Toronto, Can. Chicago, Ill.

West Coast Cresol Dip

Strongest and most effective Germ Destroyer, Insecticide and disinfectant. Made of Coal Tar Creosote Oil. Great caution must be exercised in using Carbolic Dips and those that contain Petroleum oils. Reports in 1905 from Wyoming show that many sheep died on account of dipping in petroleum. Sulphur-Lime dips impair the quality of wool on sheep, and sometimes blind them. Tobacco dips very often sicken sheep. And none of these dips can compare in effectiveness with Cresol Dips. These, while being most effective, are perfectly harmless. Wool is improved by their use, as it not only cleanses the wool but leaves no stain and gives it a soft texture.

But Cresol Dips differ very much. A Coal Tar Dip depends for its activity almost entirely upon the Cresylic Acid it contains. West Coast Dip is guaranteed to be made from Coal Tar Creosote Oil containing 25 per cent Cresylic Acid. Most dips sold in the United States are made from domestic creosote oils, which run about one-half the strength of imported oil. Permission was given by the U. S. Dept. of Agriculture to use our Dip for the treatment of sheep scab in the proportion of one part Dip to 67 parts water. This is the highest dilution we have ever heard of being permitted by the Department. When thus diluted it costs but a trifle.

For sale by many dealers. If yours does not keep it, send direct to us for trial offer, "special price and freight prepaid."

Live Stock and Dair

CALIFORNIA'S BUTTER YIELD.

THE State Dairy Bureau of California has completed its compilation of the output of dairy products in the State during the year ending September 30, 1907. As no official report is issued by the Bureau this year, this result of the Bureau's work in this line has been given to the public through the press. The work of compiling these statistics has occupied much of the attention of the Bureau during the past four months, owing to its determination to have them as accurate as possible. The figures given out are compiled almost exclusively from written reports received from the creameries and other producers. In order to show the condition of the industry throughout the State, its development and retrogression in the different counties from year to year, the production is determined by counties. Owing to the growing custom of shipping cream from one county to another to be churned, as a result of the centralized creamery system, the work of keeping the fat produced by each county separate is becoming somewhat difficult, but the Bureau believes that through the assistance rendered by the creameries that receive cream in this way the segregation presented is quite accurate.

The following table shows the production of butter by counties from September 30, 1906 to September 30, 1907:

County	Pounds
Alameda	728,767
Alpine	28,360
Amador	229,990
Butte	208,444
Calaveras	135,666
Colusa	296,662
Contra Costa	639,641
Del Norte	699,878
El Dorado	203,486
Fresno	2,786,817
Glenn	183,384
Humboldt	4,390,815
Inyo	110,566
Kern	372,569
Kings	1,960,364
Lake	87,938
Lassen	376,184
Los Angeles	953,624
Madera	112,011
Marin	3,846,758
Mariposa	19,281
Mendocino	534,359
Merced	2,469,726
Modoc	137,647
Mono	23,640
Monterey	531,801
Napa	613,109
Nevada	127,364
Orange	287,541
Placer	280,756
Plumas	356,548
Riverside	484,090
Sacramento	1,060,098
San Benito	135,730
San Bernardino	220,653
San Diego	1,241,817
San Francisco	—
San Joaquin	1,625,538
San Mateo	260,447
San Luis Obispo	1,396,524
Santa Barbara	740,292
Santa Clara	307,509
Santa Cruz	340,800
Shasta	11,540
Sierra	223,824
Siskiyou	479,627
Solano	862,179
Sonoma	3,723,941
Stanislaus	3,615,496
Sutter	329,367
Tehama	158,281
Trinity	17,466
Tulare	2,522,707
Tuolumne	32,368
Ventura	162,124
Yolo	726,532
Yuba	176,592
Total	44,599,211

Compared with previous years the past season shows up as follows:

Year	Pounds
1897	28,678,439
1898	23,691,028
1899	24,86
1900	28,78
1901	29,70
1902	31,52
1903	34,78
1904	35,63
1905	41,96
1906	44,04
1907	48,59

While the past season sets a mark in the production of butte California, the gain over the pre ing year is slight, amounting to proximately one per cent incre Comparing the separate counties the preceding year, it is interest to note the remarkable difference comparisons in the showing am the different counties. Some co ties in what may be called the dairy districts gained as high as t ty per cent, which was offset by loss in older counties. A remark instance of growth in butter prod tion is given in case of Stanis county which increased from 2,7 582 in 1906 to 3,615,469 pounds for past year. All of this butter is m in large creameries from which curate reports have been recei and there is no doubt as to the sh ing being correct. Another inter county that shows a remarkable crease in production is Tulare co ty, in which the gain was twe per cent. Among other interior co ties that show progress in butter p duction are Kings and Fresno co ties. In the southern part of State San Diego is the only cou that shows a gain, although this g is confined more properly to Imper county, which has been divided fr the former during the year cover by the table presented.

Taking up the counties that ha made no progress in production ov the preceding year, or that have r rograded, we find conspicuously Sa ramento and Yolo, two counties t heretofore have shown a s growth from year to year, the retr gression being due to the disastro flooding of the reclaimed lands du ing the early part of 1907. Oran county, in the southern part of t State, a heretofore important dai county, has suffered in butter produ tion by the exodus of dairymen in the San Joaquin and Imperial vall where lower priced lands and oth equal opportunities present the selves. The old counties in wh the dairy business established ist years ago, such as Marin, Sono Humboldt and San Luis Obispo, ha held their own, while it is nota that Mendocino, and a few of other more isolated counties, ha suffered a marked decline, which undoubtedly due to the difficulty securing laborers in isolated distric In fact, the labor situation is at t bottom of the lack of progress t the industry on the average h shown. Had it not been for this stacle, with a favorable year all ov the State so far as feed productio is concerned, few counties wou have fallen off, while it would ha brought about a vast increase in t business in the alfalfa growing di tricts.

The relative position of the lea ing counties of butter has undergon little change as a result of the la season's production. Humboldt cou ty still holds her place at the hea followed by Marin, Sonoma, Stan laus, Fresno, Tulare and Merced the order given.—W. H. Saylo Secretary.

OTHER GREAT GUERNSEY RECORD.

'e take the following from the ens, Wis., Record, referring to cow and the Helendale Farms:

is not often in the history Guernsey cattle in America one herd gains a pronounced l in Advanced Registry tests in show ring successes. A centration of the winners in herd has not before been omplished. The last A. R. test ıed at Helendale Farms places Helendale herd in a position er before attained by any one d in the United States. The herd wed at Chicago, having then four ıs leaders in the Advanced Regis-

aturday night, Nov. 23, Robiline No. 16117, A. G. C. C., completed ear's official test with a record of 59 pounds of butter fat, which es her in the coveted position in 3½ to 4-year-old class of Guern-. Her test exceeds her require-its by 3348.35 pounds milk and 99 pounds butter fat.

er feed record:

ov. 56 lbs. grain of the following ture: 4 parts bran, 2 parts oats, arts gluten, 1 part of oil meal, 1 cornmeal and ½ part Brewer's n; 140 lbs. ensilage, 42 lbs. roots, er and alfalfa hay.

ec. 279 lbs. grain mixture, 930 ensilage, 155 lbs. roots, clover alfalfa hay.

ın. Same as December.

eb. 252 lbs. grain mixture, 740 ensilage, clover and alfalfa hay.

arch. 310 lbs. grain of the fol-ng mixture: 4 parts bran, 3 s oats, 2 parts gluten, 1 part ajax es, 1 part oil meal, ½ part corn-l, 930 lbs. ensilage, clover and lfa hay.

pril. 300 lbs. grain of above mix-, 900 lbs. ensilage, clover and al- hay.

ay. 310 lbs. grain of the follow- mixture: 4 parts bran, 2 parts , 2 parts gluten, 1 part ajax es, ½ part oil meal; 620 lbs. en-ge and pasture.

t. 310 lbs. of grain of the above ure, ensilage, 310 lbs., roots, clov-nd alfalfa hay.

ov. 207 lbs. of above mixture, lbs. ensilage, clover and alfalfa

---

HAND CREAM SEPARATOR.

ıthority on the subject of farm ying will agree that any farmer milks five cows or more and is er selling the cream or making er of it, needs a centrifugal hand m separator to secure the best its.

ıe hand cream separator, work-under favorable conditions, does leave over 1-20 of a pound of er fat in 100 pounds of skim . The gravity systems and dilu- separator methods of securing butter fat will leave, under favor- conditions, from 1-3 to 3-4 of a pound of butter fat in 100 pounds of milk.

According to these figures, a farmer who uses a hand separator and milks 10 cows, which produce 60,000 pounds of milk a year, would lose in the skim milk but 30 pounds of butter fat a year on the total amount of milk. By the other methods he would lose from 200 to 450 pounds a year. Figuring butter fat at twenty cents a pound, there would be an annual loss of from $34 to $84 between the hand separator and the other methods.

Advantages of the Separator.

Not only does the machine secure practically all the butter fat, but it delivers the skim milk in a sweet, warm and undiluted condition ready to be fed to the calves. Very few dairy utensils are needed, as the milk is separated as soon as it comes from the cow and the skim milk is fed at once.

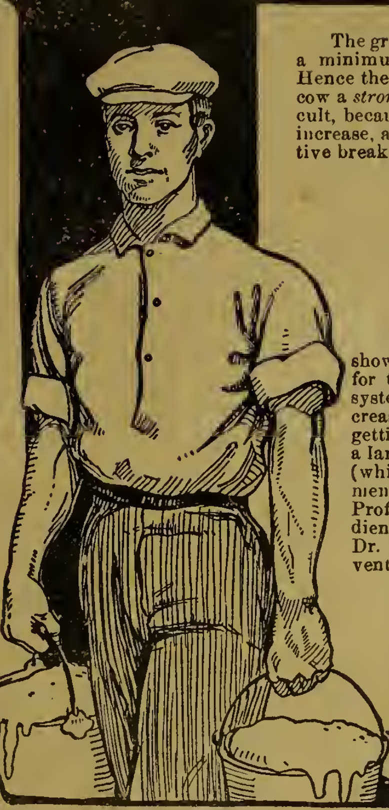
Less work is required to handle the milk in this manner than with the other method.

The cream delivered from the separator is of uniform richness; it has had all the fibrous and foreign matter removed. The milk has not absorbed bad flavors and odors from standing around and the cream is in excellent condition for ripening. Thus there is a gain in the quantity and quality of butter obtained.

Not onlly is the centrifugal separator of advantage in the production of fine butter, but it is equally advantageous in the purification of milk and cream for direct human consumption. Dairies improve the quality of their milk very much by running it through the separator and then mix the milk and cream before botling it.

The average farmer cannot afford to haul the whole milk to the creamery, even if he is within hauling distance and the roads are good. Tbe skim milk often comes back in a cold, half-sour and contaminated

Two Pails From One Cow



The greatest yield of milk requires that food waste be reduced to a minimum and food assimilation increased to a maximum. Hence the road to success as a producer of milk lies in giving the cow a *strong digestion and increasing appetite.* This seems difficult, because we are continually overfeeding in our effort after increase, and consequently inviting nervous disorders and digestive breakdown. Here

DR HESS
STOCK FOOD
A TONIC

shows its value. A tonic and mild laxative, it contains iron for the blood and nitrates to expel dead matter from the system. Its use strengthens the stomach nerves and increases the secretions. A cow, steer, horse, hog or sheep getting Dr. Hess Stock Food is in condition to benefit from a large amount of food. It makes appetite for coarse fodder (which saves grain) and by improving digestion saves nutriment that would otherwise be wasted in the excrement. Professors Winslow, Quitman and Finley Dun endorse the ingredients contained in Dr. Hess Stock Food. It is the prescription of Dr. Hess (M. D., D. V. S.) and is valuable not only as a tonic but as a preventive of disease. **Sold on a Written Guarantee.**

100 lbs. $7.00. 25 lb. pail $2.00.
Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is the dose—it's small and fed but twice a day. which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal preparation, and this paper is back of the guarantee.

Free from the 1st to the 10th of each month—Dr. Hess (M. D., D. V. S.) will prescribe for your ailing animals. You can have his 96-page Veterinary Book free any time for the asking. Mention this paper.

MAKING CREAM SEPARATOR HISTORY

The year 1908 will mark an important period in the history of the centrifugal cream separator. Probably never again will such a large number of valuable separator improvements be brought forth at one time as are now shown in the new improved 1908 De Laval machines. After thirty years of ceaseless testing and experimenting and the expenditure of many thousands of dollars, the really perfect cream separator has at last been produced in the new De Laval. Nothing anywhere near like it has ever been made before and all who have seen and examined it marvel at the great degree of perfection which has been attained in every feature of the machine from the supply can to the base. Although the improved De Laval has only recently been placed on the market it is already SWEEPING ALL COMPETITION ASIDE and experienced buyers everywhere are saying of it—"YOU DON'T CLAIM NEARLY ENOUGH." The many new De Laval improvements are of almost equal importance with the invention of the separator itself and must be seen to be fully appreciated. To this end you may have a free demonstration of the machine in your own home for the asking. Write us today for full particulars and receive our handsome new catalogue illustrating and describing the machines and improvements in detail

Pumped by
The New Pomona Deep Well Pump Head

Pomona Mfg. Co., Pomona

Riverside, Cal., October 8, 1907.

POMONA MANUFACTURING CO., Pomona, Cal.

Gentlemen:—In reply to yours requesting privilege of photographing our pumping plant which you installed for us last spring will say: You are perfectly welcome to take as many photos as you wish, and as our season for pumping is practically over, it may be of interest to you to know something of what we have been doing with it. We have raised forty inches of water about two hundred and fifty feet, delivering it through a six-inch pipe line to our reservoir about one and one-half miles distant from the well. The pump is driven by a forty-horse power electric motor, and our tests have shown the actual horse power used to be twenty-seven horse power. The pump has worked perfectly all through the season and is in perfect condition today. It has come up to all that you represented it and met our every expectation. Should you wish to refer to our plant at any time, you will always find it open for your inspection. Yours truly.

condition, which is unfit for feeding purposes. Even if it does come back in good condition, it is impossible to feed it regularly, and it is far from being equal to hand separator milk. Too much time is required to haul it to the creamery compared to the length of time required to separate it at home by hand. The hand separator cream, by careful handling, need not be hauled to the creamery oftener than every other day during the summer and perhaps not oftener than once in three days during the winter months.

Hand separators may be procured in sizes varying in capacity from 150 pounds of milk (18 gallons) an hour to 1200 pounds (144 gallons) an hour. The prices varying from about $40 for the smaller size to about $175 for the larger size, depending upon the particular make.

A farmer who milks 10 cows, obtaining from them say 300 pounds of milk a day, or 150 pounds at each milking, should be able to separate it in fifteen minutes. This will require a separator of 600 pounds capacity an hour, which would cost about $100.

The average separator of standard or reliable make should last, with good care, for 12 or 15 years, with very few repairs.—H. M. Bainer, Prof. of Farm Mechanics, Colorado Agricultural College.

THE EFFECT OF HEAVY MILKING ON THE PROGENY.

In a recent number of the Tribune Farmer a man writes to Dr. Smead stating that he has a cow that drops a vigorous calf only about every other year, that the cow was never dry except about three weeks before calving. She has always been a large milker. The doctor tells him that the cow is evidently one whose heavy milking qualities impairs her ability to properly nourish and build up her calf while in embryo. He further tells the owner to be careful to feed the cow well of ground oats, corn meal and bran, while she is milking and while dry. The idea is, that this cow must have sufficient right food to build well the body of the calf. There is nothing but the best of good sense in that advice. He should have advised him to let the cow go dry at least 60 days, instead of 21 days; so short a period as that is very apt to produce serious udder troubles. In these days of ambition to produce cows of great capacity and make them yield largely at the pail, it is well to remember the calf that is to be born. There must be reason in all things.

The cow cannot turn all the nourishment she derives from the food she gets into the milk pail and still have enough to build up her offspring rightly. We want good calves from these good cows. The owner of the cow must do his share to that end. He must see to it that the mother has enough of the right kind of food and goes dry long enough to do that work rightly.—Hoard's Dairyman.

NOT BASHFUL ABOUT ASKING.

"I think that Williams is the nerviest chap I ever met."

"Well, what has he done?"

"Came over the other day and borrowed my rifle to shoot a dog that was bothering him nights."

"What of it?"

"It was my dog."

GOVERNMENT LANDS — CONDITIONS favorable as to land and water; close to a good town. For further information call at 909 E. FIFTH Street, Los Angeles, Cal., or write H. C. DECKER, R. D. 1, Burbank, Cal.

MISCELLANEOUS.

INVISIBLE POST CARDS—HERE'S something new, neat and novel in the souvenir postal card series that is certain to become universally popular and will amuse and astonish both old and young by the magical appearance. Enclose 10 cents for assorted package. F. ROGERS, Dept. 7, Box 396, Long Beach, Cal.

DELMONICO'S CHEF SAYS: "THE ANchor egg separator works perfectly; no well regulated hotel or household can afford to be without it." Send ten cents, or ten names of persons keeping poultry, and we will send one postpaid. WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

FOR SALE—TWO HUNDRED THOUSAND Palmetto asparagus plants. Also four varieties of almond trees. Extra fine stock of plums, peaches, pomegranates, etc. IMPERIAL VALLEY NURSERY, Imperial, Cal.

I HAVE TEN HIVES OF BEES FOR SALE on my ranch near Crafton. Address L. LODGE, 1375 East Ocean Ave., Long Beach, Cal.

TWO BIT AD PAYS.

My two bit add, under the head of "Berry plants," brought me as many inquiries as did the one for Rhode Island Red cockerels.—J. M. Geary, Carpinteria.

THE CARE OF A WAGON.

The useful life of a wagon or dray employed in heavy hauling depends very largely on the care of its wheels and axles.

Hosts of farmers and teamsters, who ought to know better, think that "grease is just grease anyway" and so cut the boxes out of their wagon wheels by using some inferior lubricant which runs off and leaves the spindle dry, or forms a stiff, almost gritty substance in the wheel which is just as bad.

A proper axle grease for use on every type of heavy wagon should have just the right "body"—that is, it ought to be neither so thin as to run nor so heavy as to stiffen.

It should have, too, a long-lasting quality if it is to be economical.

Perhaps no preparation for the purpose is quite as good as Mica Axle Grease. Certainly no other axle lubricant on the market possesses what we have termed "proper qualities" as truly as "Mica" does. A very little of it goes a long way and saves the teamster much loss and trouble.

One valuable quality of Mica Axle Grease is the anti-friction property which it possesses, aside from its lubricating power. It contains powdered mica, which coats the wagon axle with a smooth glass-like surface on which wheels turn easily and with the minimum of wear.

A little Topeka girl came home from church the other day, and was asked what the minister's text was. "Don't be afraid and I will get a bed quilt," was the astonishing answer. Investigation proved that the central thought of the sermon had been "Fear not, and I will send you a comforter."—The Technical World .

DOES MA WISH SHE WAS PA?

"I wish I had lot o' cash,"
Sez pa, one winter's night;
"I'd go down South an' stay a while
Where days are warm and bright."
He set an' watched the fire die
(Seemed lost in thoughtful daze),
Till ma brought in some fresh pine knots
An' made a cheerful blaze.

"I wish I had a million shares
O' stock in Standard Oil,"
Sez pa; "I wouldn't do a thing."
Ma made the kettle boil,
An' mixed hot biscuits, fried some ham
An' eggs (smelt good, you bet!)
Fetched cheese an' doughnuts, made the tea,
Then pa—set down an' et!

"I wish I was a millionaire,"
Sez pa; "I'd have a snap."
Next, from the lounge, we heard a snore:
Pa—at his ev'in' nap!
Ma did the dishes, shook the cloth,
Brushed up; put things away,
An' fed the cat, then started up
Her plans for bakin' day.

She washed an' put some beans to soak,
An' set some bread to rise;
Unstrung dried apples, soaked 'em, too,
All ready for her pies;
She brought more wood, put out the cat,
Then darned four pairs o' socks;
Pa woke, an' sez, "It's time for bed;
Ma, have you wound both clocks?"

—Mary F. K. Hutchinson in March Woman's Home Companion.

THE GIRL AND THE TEST.

THE teacher stood watching the class in algebra take a test. It was a fair examination, containing no "catch" questions, but problems similar to those which the pupils had solved day after day. There was no need of haste, for the teacher had said, "Work carefully, taking the problems in order; I shall rank you on what you do, whether five or two." Again, "Do not hurry; it is correctness, not amount, which counts."

The boys were working deliberately, with here and there a frown at a problem which would not "come right;" but there was no such placidity among the girls. Each face was tense, fingers flew, there were mad dashes after erasers, gasps of consternation, and one girl, with hands clenched, actually jumped up and down in her seat. At the striking of the gong they filed out of the room utterly wearied. All this nervous force was expended on an ordinary test, the like of which, in some study, they met once a week.

The papers handed in were such as one would expect under these conditions. Those written by girls who work best under pressure were perfect, but most of them fell below the daily work; several contained portions of each problem, but not one completed. The owners proffered time-worn excuses with glibness: "I never do anything on tests;" "I always go to pieces;" "I had a headache;" and over and over, "I was nervous."

For once they received no sympathy; the teacher had been considering whether or not an examination is such an ordeal as it is customarily considered. When she returned the corrected papers she talked not about the failure in mathematics, but the failure in self-control.

"I can teach you mathematics," she said, "but I can't teach you self-control. No one but you yourself
can teach that. You offer 'r

en writing advertisers, mention Cultivator.

ease, to be avoided when possible, and its victims isolated, it would no longer be a handy excuse nor an interesting state; and wondrous peace would settle over girldom.—The Interior.

SAVORY SAUCES.

White Sauce.

One tablespoon butter, one tablespoon flour, one cup milk, salt and white pepper to taste, melt the butter in a small granite or porcelain lined saucepan. Stir in the flour, taking care that this does not brown. When the mixture begins to bubble pour in the milk (it is better to have this warm) and stir until it thickens. Should it be too stiff add a little more milk. Season just as you take from the fire.

Bechamel Sause (for meat.)

One tablespoon butter, one tablespoon flour, half pint well seasoned and strained white stock from boiled veal or chicken, one gill cream. Cook butter and flour together, as in making white sauce. When they thicken well add the cream and take at once from the fire.

Bechamel Sauce, (for fish.)

Make in the same manner as the foregoing, substituting for the half pint of white stock the same amount of fish stock, made by putting the bones and trimmings of a fish with a bunch of sweet herbs, salt, pepper, a slice of onion and one carrot in one quart of water, and boiling this down to half pint. Add the gill of cream to this also.

Oyster Sauce.

One tablespoon butter, one tablespoon flour, one gill oyster liquor, one gill rich milk or cream, one dozen small oyster, half teaspoon lemon juice. Heat the oyster liquor to boiling, and cook the oysters in it about three minutes, till they begin to plump. Take them out, steam the liquor, put it with the milk, and pour both upon the butter and flour when they have reached the bubbling point in the saucepan. Stir all until thick and then drop in the cooked oysters, each cut in three pieces. Take from the fire at once, and add seasoning and lemon juice. This is good with boiled or baked fish or boiled fowl.

Loubise Sauce.

To a cup of white sauce add two medium sized onions, which have previously been boiled tender and chopped fine. Good with mutton boiled or roasted.

Brown Sauce.

One tablespoon flour, one tablespoon butter, half pint highly seasoned brown stock. Cook the butter and flour together in a sauce pan until they are a light brown, stirring constantly. Add to them the stock and stir until it thickens. This sauce to some tastes is improved by the addition of a teaspoon of Worcestershire sauce or walnut catsup. If the flour is browned before cooking it will expedite the process of making the sauce.

Butter Sauce.

Make as directed for white sauce, substituting boiling water for milk.

* * *

A New Prune Pudding.

Take one pound of good prunes and after washing them well cover with water and soak over night. In the morning add half a cupful of sugar and simmer over the fire until tender. Then slip out the stones and chop the prunes, break the stones, remove the kernels, pound the kernels to a paste and add to the prunes. This gives to the pudding the flavor of dates. Beat the whites of two eggs until stiff and stir lightly into the prune mixture; then place in a moderate oven and bake about twenty minutes. Serve with whipped cream or thick custard.

Brownies.

One cup sugar, one-half cup butter, two eggs, two squares choclate melted, one-half cup of flour, one-half cup raisins, walnuts or peanuts. Favor with vanilla, bake in a moderate oven and when cool cut in small squares. These are very nice for lunch or afternoon tea.

Novel Maccaroons.

One cup sugar, two eggs, well beaten; pinch salt, one-half cup shredded cocoanut, one and one-half cups oatmeal, from the package, dry. Flavor with vanilla. After mixing thoroughly, drop on buttered tins and bake about ten minutes in a comparatively hot oven. This will make seventeen or eighteen. They are literally delicious and inexpensive.

THE HOME DRESSMAKER.

Do not think it necessary to buy a new shirtwaist pattern each season. Buy a plain pattern of standard make and size required. Place it on some cheap lining material and cut out, then carry it to a reliable dressmaker and have her fit it carefully. You will then be saved the time and worry of fitting your waist each time, which means much time and worry saved to a busy housekeeper.

If tucks are desired, place them in the material before placing pattern on the goods. After the waist is cut out, the next step should be the marking of the perforations on the material for plaits. Also, those indicating the underarm, shoulder, seam and waist line. When a waist needs altering the changes are made in the shoulder seam and underarm.

When shoulder seams are desired longer than the pattern, split pattern through center of shoulder down to bottom of pattern, place the two pieces of pattern on material separating the amount required to lengthen shoulder.

If more fullness is desired at waist line, separate pattern two or more inches at that point.

If shoulder is to be shortened, lap pattern instead of opening.

Back of pattern is placed the same way.

Slash seam of neck band several times after first seam is sewed, the neck band will then fit much better.

Shoulder seams are stitched on wrong side, then stitched twice on right side with seam turned to front.

To arrange fullness in back of waist, measure from neck to waist line for length of back, then from the two underarm seams for width of back. Arrange fullness into a five-inch space, stitch tape across the fullness, allowing enough to go around waist.

Gather top of sleeve in two rows. Always hold gathers towards you when placing sleeve in arm eye.

The left side of the waist is turned inside out. Bring the inside seam of the sleeve to the notch in front, place notch in upper part of sleeve at shoulder seam. Pin securely at two points, pin the plain portion of the sleeve smoothly into arm eye. Draw gathers up to fit the remaining space and baste carefully Stitch with bias strip of lawn next to waist and hem down by hand over gathers.

Cuffs are cut lengthwise of material and are stitched one row close to gathers and another one inch below. Sides and bottom are stitched one-quarter of an inch from edge. Buttonholes are worked lengthwise of plait.—Rebecca Boswell, Instructor in Domestic Art, Colorado Agricultural College.

The Produce Markets

Los Angeles Markets

Butter.

LOS ANGELES, March 4, 1908.—A decline of 2½ cents in quotations is noted this week, and heavy receipts have caused offers of a cent under quotations by some holders.

Creamery ex per roll	57½
Firsts	50@50½
Dairy	45
Cooking	42@47
Eastern	50
"Butterine"	15@20

Cheese.

California Anchor	18

Citrus Market

LOS ANGELES, March 4, 1908.—Auction markets are much the same as a week ago, but the Middle Western markets are stronger. This in face of one of the biggest Februarys, so far as quantity of shipments are concerned. The fruit has carried finely and no complaint is made as to decay as yet. This is for two reasons, the cool, favorable season and the further fact that greater care is taken in handling fruit this year than ever before.

Probably no fruit shipping section ever forwarded finer packed fruit than is going out of the citrus packing houses of California this year.

Lemons are slightly weaker owing to heavy receipts of foreigns. Fair prices prevail, however.

Shipments.

Shipments to date are 9972, of which 1467 were lemons. Last year same date 8078, of which 977 were lemons.

NEW YORK CITY, March 2.—Thirty-two cars navels, three cars lemons and one car bloods sold. The market opened steady on navels, but weakened the latter half of the sale, and at the close prices were lower c sizes. Lemons are higher. W unfavorable; raining.

THE THOMPSON ALFALFA AND GRASS SEED SOWER.

Everybody who has alfalfa or other grass seed to sow ought to be interested in the old reliable Thompson Grass Seeder. It is now over 35 years old. There are over 200,000 in use and it is used all over the world.

Its advantages for sowing alfalfa seed are just beginning to be rightly appreciated. That acounts in a measure, at least, for its recent large increase in sales.

The qualities which are making the Thompson Seeder so popular with alfalfa growers, are the same that years ago gave it such a general use for sowing all kinds of grass seeds.

The manufacturers, O. E. Thompson & Sons, Ypsilanti, Mich., have recently gotten out a most valuable booklet on alfalfa. It is not large, but it covers the whole subject. If you do not already know all about alfalfa you can get it in this book. It is an atractive, readable form and the information it gives about alfalfa can be relied upon. The booklet is for distribution. If you are interested in alfalfa growing, write to the manufacturers at the above address and have them send you a copy which they will do if you mention the Cultivator.

PROTECTS THE TREES.

"TREE TANGLEFOOT" IS AN EFFECTBAR TO INSECT PESTS.

A sticky preparation applied directlyl to the bark of trees, and known as "Tree Tanglefoot," has been used very extensively with great success in New England against the gypsy and browntail moths, and in the California prune orchards against the canker worm. It will not injure trees, and is applied to make a band five inches wide and one-sixteenth of an inch thick. No climbing insect pest can cross this. It remains sticky much longer than any other known substance. All who wish to preserve fruit or shade trees will find that the slight expense of "Tree Tangelfoot" bears no comparison to the benefit it will confer. It costs only 25 cents per pound, much less in greater quantities, and should be applied when the caterpillars begin to crawl. Any one can apply it, as no apparatus is required. If you are unable to secure a supply of Tree Tanglefoot from your seed dealer, write the manufacturers, the O. & W. Thum Company, Grand Rapids, Mich.

Immense quantities of grain are being removed from Lewiston, Idaho, toward the coast shipping points. Over one million bushels of grain have been stored there.

UNITED STATES CREAM SEPARATORS FOR 1908

Have all the qualities that have made the U. S. the standard for many years past, for efficiency, durability and reliability, and have in addition

New and Important Improvements

both in construction and efficiency—increasing their already unequaled ability to handle milk most easily, quickly, profitably. Remember: you are buying a cream separator first of all to get all the cream—all the money—out of your milk and the U. S. Cream Separator continues to

Hold World's Record for Clean Skimming

for fifty consecutive runs, in competition with the leading makes of separators of the world. This record has never been equaled.

Furthermore: the past sixteen years have conclusively demonstrated the durability and the unequaled reliability of the U. S. Dairymen to-day buy the U. S. because they know it will do for them the best work for the longest time. Competing separators "claim" anything and everything, truthful and otherwise, but the real superiority of the United States Cream Separator has been so thoroughly established in every way, that no one can successfully dispute it. This is so widely known and acknowledged nowadays that dairymen in all parts of the country are rapidly exchanging their old style, unsatisfactory, "cheap" and unreliable separators for the clean-skimming, STANDARD and reliable U. S.

SEND FOR IT TO NEW YORK

NEW YORK IS THE PLACE FOR IT!

We Are Overstocked **SPRAYER $3** **We Must Unloa**

No stopping to pump air.

You will get the regular **LENOX IMPROVED SPRAYER** for $3, 2 for $5, by sending for it to New York. **BEATS THEM ALL. ALL IMPROVEMENTS.** It will spray trees **20 FT. HIGH**, holds 24 quarts, built of Apollo galvanized iron. Never rusts, never leaks; forcible and fine spray. **DON'T TALK LONG.** It will do your **STRAWBERRIES, VINEYARD, GRAPES** and all your small fruits, **POTATOES, TOMATOES, CABBAGE** and everything on your place. **WHITEWASHING** the hen house, cow stables, etc. A well-built machine, with care and if not abused, we will warrant it good for 12 years. Turn nozzle up, spray will reach all insects upon the ceilings in stables, breeding nests, in poultry houses, in all crevices and cracks, particularly **THE UNDER SIDE OF THE ROOSTS**, and between the **HORNS OF THE COW**, where most of the trouble comes from.

NO AIR PUMP BUSINESS. So easy **A LADY CAN USE IT. NO STOPPING TO PUMP AIR** or to **SWEAR.** Compress the bulb, you get your spray; stop your pressure and you stop the spray, on the principle of an engine **PLUNGER** pumping water, only much easier. By pressing and releasing the bulb, spray continuously reaches top of tree without artificial power. You can put your hand inside of sprayer to wash it out as easily as you would a milk can.

NO SWEAR

$3.00
2 for $5
Just Now!

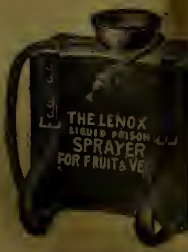
Better Milk and More of it.

LOTS OF TIMES you can use a knapsack sprayer in places where you can not a barrel pump. While talking or hitching up the horses the work is done. Handy at any place. Even if you have a barrel pump you will use this one anyhow. Lots of times a patch off yonder ought to be sprayed, but won't pay to hitch up the horses. If this machine is handy John will sling it on his back and the spraying will be done while you are thinking. Send for our circular. YOU SHOULD KNOW ALL ABOUT IT. Or perfectly safe to send for the sprayer direct without waiting for the circular. A small can "Sure Destruction to San Jose Scale" sent free with each sprayer, if ordered at once.

A RECIPE issued by a chemist, how to prepare a sanitary lime milk for a whitewash that will stick and stay on the walls of the hen house, trees or stable walls, making insect breeding impossible. Anyone can make it cheaply and quickly wherever located. This recipe will be sent **complimentary with each sprayer, if ordered immediately.**

REMEMBER this is the regular $5 Sprayer we are talking about, but we made too many; we would rather sell at $3 than wait until next season to get $5. **JUST NOW** you can have **ONE FOR $3** or **TWO FOR $5.** Order before they are gone. Time counts. **NO LENGTHY LETTERS** necessary. We will know what you want—that you want one of these **LENOX IMPROVED SPRAYERS**, perhaps a couple of them, and that you want them quick, too; but give us your name and address very plainly. **PROMPT SHIPMENT.** Twenty-four hours delivery. **EXPRESS RATES FROM NEW YORK LOWER THAN FROM ANY OTHER POINT.** Newspaper people have known us for over 20 years. We are old advertisers. What we say **WE DO, we DO-DO.** You can discount all our promises **AT YOUR BANK.**

BECAUSE WE A
OVERSTOCK
YOU GET IT
THIS PRICE



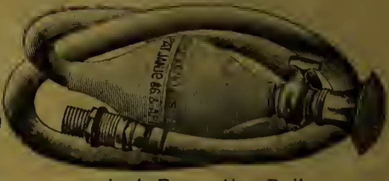
THE LENOX LIQUID POISON SPRAYER FOR FRUIT & VE

NO AIR PUMPING

Remit by express or post money-order; no checks taken for this price. Go down to the **POST OFFICE** now while you are talking about it. You may your Spraying Solution and the Disinfecting Mixture all ready. The expressman will soon drive up to your house with the sprayer, and it will be a good too, **VERY WELL FIT** even to take orders for, if wanted from neighbors and neighboring towns. **THE LENOX IMPROVED** is the **STANDARD KNAPS SPRAYER**, beats them all; you take no chances when you have a **LENOX.** You won't have to stop from work to take it to the machine shop to find o is the matter with the air-pump chamber or the nozzle, or anything else. No air-pump nuisance in this case. Our Lenox is ever ready, never failin

THE
Lenox Barrel Attachments
(IMPROVED)

$2.00 Post-Paid



2 1-2 Feet Long

Just Press the Bulb.

Will throw a spray on good sized trees. Press you thumb upon the bulb, you get your spray, stop your pre sure and you stop the spray. Has a strainer in th threaded end which screws into the barrel; best rubbe hose, brass valves front and rear, operates by vacuum the same as a pump, only much easier. Can be attach to a barrel or milk can, or to any kind of tank, a five o ten gal. keg, kerosene or whisky barrel. Bore a 3-4 inc hole and screw in the nipple, it will not leak. For po tatoes, cabbage, grape vines and all low stuff, it will d the work of a $10 sprayer and much better.

GROW YOUR OWN VEGETABLES

California Cultivator

s Angeles March 12, 1908 San Francisco

A Field of Calla Lilies

A Beautiful Flower, Hardy Enough for Most Sections of California Desirable for Hedge or Border of Grounds

NE OF the most successful flowers for California is the calla lily. Of course, in the hotter interior valleys its growth is attended with more difficulty, but with reasonable care it give satisfaction in nearly all sections. Of course it will stand ittle or no frost, so that slight protection is necessary when ipping weather comes. Near the coast at Santa Barbara we seen it growing in large grounds along a canyon stream as ally as the wild flowers and with no more apparent care. At it has been cultivatd in large fields as a commercial venture, as not proved a great success financially. But for its mass oom and the certainty of its returns, it is one of our best for home grounds. It makes a good hedge or dividing line.

The heaviest bloom comes usually about Easter time and wagon loads, almost, are sometimes used. We once saw 1330 calla blossoms about a church altar at Pomona and it was, indeed, a beautiful sight.

Give the calla not too strong sun, no frost, loose, rich soil, plenty of moisture and you will be astonished at its mass of bloom. It will bloom the year through or may, in the warmer sections, be allowed to rest through the summer months.

Remove from ground and divide every two or three years, as it becomes too matted if allowed to remain in one location too long.

XXX—No. 11 Los Angeles, California, Thursday, March 12, 1908 Subscription $1 a Year

he Econmic Value of the Home Garden

From His Ripe Experience in Vegetable Gardening, Q. A. Lobingier, of San Gabriel, Gives a Valuable Fund of Information. The Home Garden is Both a Luxury and an Economy.

OMPARATIVELY few people realize the value that is attached to a well kept home garden. The word value is not to be con- d alone in dollars and cents, but should in- the health that is promoted by the liberal vegetables and fruits, the comfort and sat- ion of having these things fresh and crisp ean from your own grounds, and the refining nobling influences erected upon the lines of whose homes are embellished with flowers wns and ornamental trees.

Grown Best.

esume the most frequent excuse given in rnia for not having a good garden is, "I can ly vegetables and fruits cheaper than I can them." Possibly true in some cases, es- ly if confined to the cost in money. But ou buy them as good? People who have once upplies from a well kept home garden are satisfied with the stale and wilted articles able at the grocery or from the street wagon. is no comparison between the vegetables ruits gathered fresh from the home grounds hose that have been gathered from 24 to 60 and exposed to air and sun and dirt and handling before reaching the consumer. h many vegetables and fruits the process of begins as soon os they are taken from the d. This is particularly true of peas, beans, es and celery and almost all of the berries. important, then, to have them fresh.

ven a Lettuce Bed.

s not expected every family can have a gar- specially those who live in the city or town. mazing thing is that so few of those who do ve in town, have not even a lettuce bed. It is ishing how small an area will supply the fam- ble, if intelligently and industrially worked. not the area, but the way you handle it, that s. A story comes down to us from the h that illustrates this question of intensive ning.

renchman had a vineyard of four acres afforded him a stated income, and on the age of his oldest daughter he gave her half neyard as her dowry. Continuing to put the labor and thoughts to the care of his remain- vo acres, he found his income precisely as it een from the original four acres. Later his second daughter married he gave her the f his two acres as her dowry, and continued to put the same care on his remaining one acre that he had used on the original four, with the result that his income was undiminished. Doubtless there is a limit to this process, but I confess that the longer I continue in this work the more difficult I find to say just at what point the limit shall be placed.

Don't Know How.

Many people are deterred from an effort to have a good home garden because of a lack of knowledge of gardening operations. The modern seed catalogue from our best seedsmen are to be had for the asking and they are full of information for the novice. Many of our large seed houses issue leaflets giving special information relative to growing the different kinds of vegetables and some of the fruits, so that if one really desires to make a beginning they can get instruction that will enable them to make a fair start. The work is full of interest, that, if followed with enthusiasm, is simply without a limit, giving play to the intellectual faculties as no other occupation.

Give the Boys and Girls a Garden.

Encourage the boys and girls in this work by pay or prizes or any method you may deem best, and see what a vast amount of good it will do for them, and you. Give them a garden space protected from dogs and chickens, and not too close to large trees, and arrange for irrigation. See that they have suitable tools. If the birds are troublesome, set up a couple of boards eight inches wide and cover with cheese cloth or wire netting with three-fourths-inch mesh. A couple of hundred strawberry plants treated this way would give you fresh berries almost the entire summer. Have a garden, even if it is but a letuce bed.

Always Have Lettuce.

Lettuce should be on the table at least once a day, every day in the year. No relish is more wholesome or beneficial to health than lettuce, especially the type known as butterhead. The California cream butter is a variety of surpassing excellence when well grown, and so crisp and tender and free from bitterness that it can be eaten like celery. While all varieties are more or less difficult to grow in August and September, if the soil be shadowed by muslin placed five or six feet above the ground, it can be grown even in the hottest weather.

Many a neglected back yard could be made a place restful to the eye and valuable to the family by using it for a garden. Many of us have read of the old darkey who stated "he allus sized up de religion ob a family by de condition o de back yawd." He was not far wrong, and we may all be justified in judging the charcater of the people by the outlook from the back door.

Use the Back Yard.

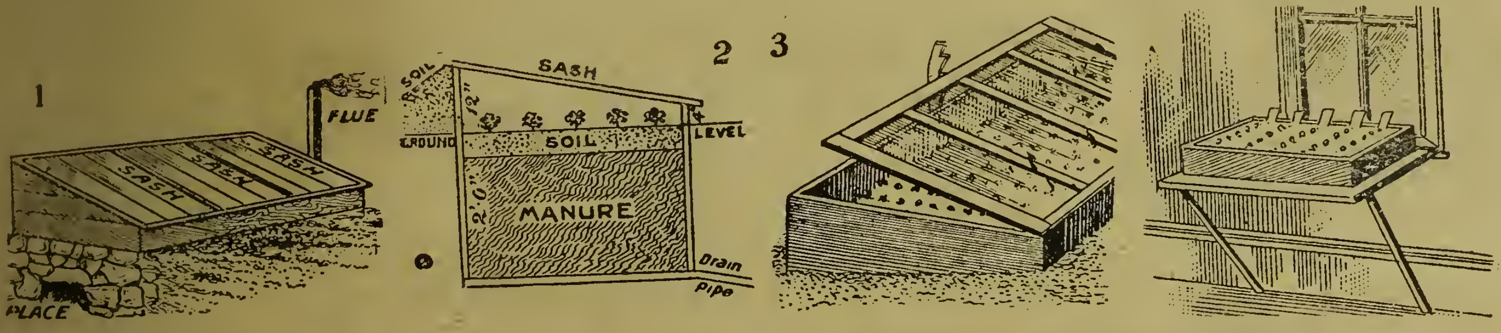
Hundreds of back yards in town or city, that are now not only unproductive, but a positive disgrace to the people who control them, could be made, with comparatively little labor, to produce an abundant supply of grapes, berries and tomatoes, thus giving profitable return for the labor, to say nothing of the refining influence always exerted over people whose suroundings are a credit instead of a shame. If this view is correct in relation to the village or town lot, what shall be said of the ranch homes whose inmates comprise by far the larger number of the Cultivator's readers?

The garden here should hold a larger and more comprehensive place in our thoughts and work. Even on a ranch of but five acres, one acre is not too much to set aside for the home grounds. Wisely planned this will afford space for buildings, including a place for poultry and fruit and vegetables as well as lawns and flowers and ornamental trees. Let those who think this is too much to spare for this purpose, give a little better care to the remainder of the ranch, and they can soon make good any supposed loss. The family in the country home is entitled to the very best the earth affords—then why not have it? It is possible here in California. With our matchless climate we can have a greater variety than can be grown anywhere else, if we will but plan and work for it.

Uncle John's Farm.

What a glorious thing it would be if all who live in country homes could give to their children, at least as a partial heritage, such tender and precious memories for their old age as Mark Twain expresses in his Autobiography, in speaking of his Uncle John's farm, where he spent two or three months every year during his boyhood. "It was a heavenly place for a boy, that farm of my Uncle John's. The house was a double log one, with a spacious floor (roofed in) connecting it with the kitchen. In the summer the table was set in the midle of that shady and breezy floor, and the sumptuous meals—well it makes me cry

Continued on Page 298.



Even though we have the best climate on earth, the early spring months are l, especially at night, so that we need help in forwarding the more tender vegeles The sketches herewith describes better than words, some of these helps. o. 1 illustrates a hotbed heated with fuel. While this method is not often orted to by farmers or fruit growers, it is valuable to the market gardener, and flues can be made of stone or brick or terra cotta pipe. Difficulty with the ft can be overcome by placing an incubator lamp under the chimney elbow at end of the structure. This will heat the elbow and pipe so that a column of air will rise in the chimney and create a good draft. I once had three green- ses each 100 feet long heated by brick flues. There was a furnace for each side house and the flue passing from the furnace to the extreme end of the e was in each case returned through the middle house to the chimney, which s built directly on top of the furnace. This was possible because the furnace was securely arched over and the whole being made solid enough to support the chimney, which was 36 feet high. The hot air from the arch of the furnace passed directly up the chimney, creating a draft so strong that tender plants were safe at the extreme end of the houses when the mercury was 10 degrees below zero outside. The suggestion of the lamp is precisely the same principle applied on a smaller scale.

No. 2 shows a hotbed heated with horse manure. Two feet in depth would be sufficient for the manure in this climate.

No. 3 shows how the sashes should be placed over the hotbed or as they should be in an ordinary old frame, which is simply a wooden frame covered with glazed sashes, placed over good garden soil without artificial heat.

No. 4 is a suggestion for a sunny window, that can be made to serve a good purpose in the starting of many tender plants.

Dry Farming

Mr. H. L. Musser, the writer of this article, is giving his experience handling of vegetables and small farm crops without irrigation. He also r the success of others in this kind of farming, but his own experience may as reader that whatever he advises in this article is authentic. —Ed.

MR. CAMPBELL has now studied dry farming until it has become not only an exact science but a practical and dependable fact. It is simply a question of the thorough working of the soil, according to the Campbell Method. Mr. Campbell says: "It is more important than the rainfall. I cannot tell you why, but after a certain amount of rain has fallen and penetrated a certain distance into the soil, each particle of earth absorbs its share of the water until the entire rainfall has been absorbed. If we can hold this water in the soil during the summer season a chemical action will follow, which produces nitrates and generates bacteria or nitrogen in the soil."

So far Mr. Campbell's teachings apply only to localities where colder winters prevail. We will c the same method to our Ca climate and conditions. To farming by the Campbell here: Plow as early [illegible] the the condition of the soil will and as soon as possible afte ing harrow to pulverize and le surface; follow the harrow w sub-surface packer to close u air cavities left by the plow t the surface, as they are lik cause the soil to harden, an would retard the growth of any coming in touch with it.

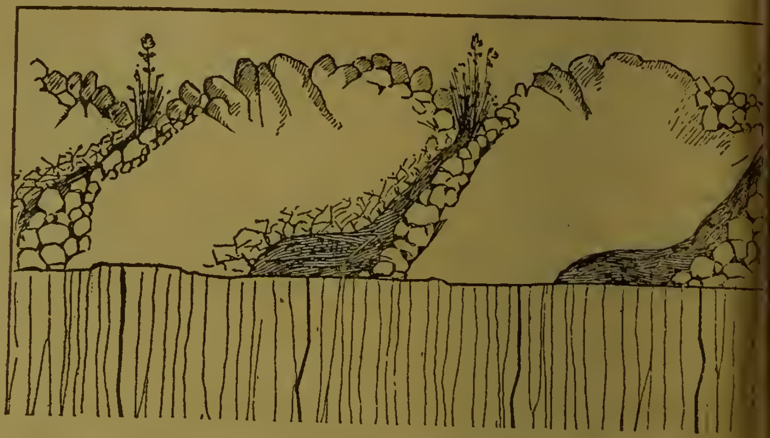

FIG. 1 AFTER PLOWING AND BEFORE USING PACKER.

Now, with a good depth of furrow-slice nicely laid over, we come to a and condition of soil tillage that has baffled many a progressive farmer caused a loss of millions of dollars, and that is the loose condition in the bott of the furrow, as shown in Figure 1.

Figure 1 represents a cross-section of the furrows as the plow leaves th Notice particularly the stubble and weeds, also the loose, lumpy condition tween each furrow and under the right-hand edge of each. This condition the bottom is rarely changed with the ordinary methods of tillage. The dr ging, which is usually done crosswise of the furrow, simply draws the soil fr the higher point into the low places between the furrows, and scarcely affe the bottom at all. Right here is one of the most serious difficulties the far er has to contend with, because it means dollars right out of his pocket.

Ready for Rain and Seed.

The soil is now in the best tion to receive the rainfall. A as possible after each rain, p ize the surface over and acros a disk harrow; a 14-inch dis the best work.

Your soil is now ready to re any seed that is seasonable. I November, December, Janua February, plant according t mean temperature of your lo oats, wheat, barley, alfalfa, fenugreek, burr clover, any grain or fodder crop; or of tables plant Wonderful lettuce toes, transplant onions, cabba cauliflower; sow turnips, beet rots, radishes, kohlrabi, pea kindred hardy vegetables.

In February bed out swe tatoes for plants, sow tomat in hot beds.

In March continue to harr soil and plant peas, the mor varieties of beans, corn, cu cantaloupe, potatoes, squa onion seed for fall crop.

In April harrow again and watermelons, cantaloupes, bers, pumpkins, squash, cor toes, millet, all kinds of fodd all kinds of beans, Iceberg okra, Roselle and Summer spinach. Transplant sweet p and tomatoes.

Now Harrow Some More.

May—Harrow again and pl watermelons, cantaloupes, and th the month to plant all varieti casabas and the Santa Claus m and grow them, if possible, with irrigation, and you can do this if soil has been properly cared f Also plant okra, squash, p

m now until the rain falls the

"he farmed his crop before he put the seed in the ground, after which there was little work required." Mr. Rule also told me that many a piece of good land was ruined by injudicious irrigation. He pointed out such a piece to me and indeed it seemed (as he expressed it) "dead."

Nothing but a year of Campbell's method of cultivation can redeem such a piece of "dead" land.

The following are a few crops more suitable for dry farming than others: With the rainy season for a start all kinds of grain will mature a good crop under the Campbell method. On the Denker ranch the Campbell method was unwitingly applied to growing lima beans.

But from the first of April until June 1st you can safely plant all kinds of vine seeds, watermelons, cantaloupes, pumpkins and squash and casabas in particular. Millet, sorghum and fodder corn will surely yield a good crop, as was proven dur-

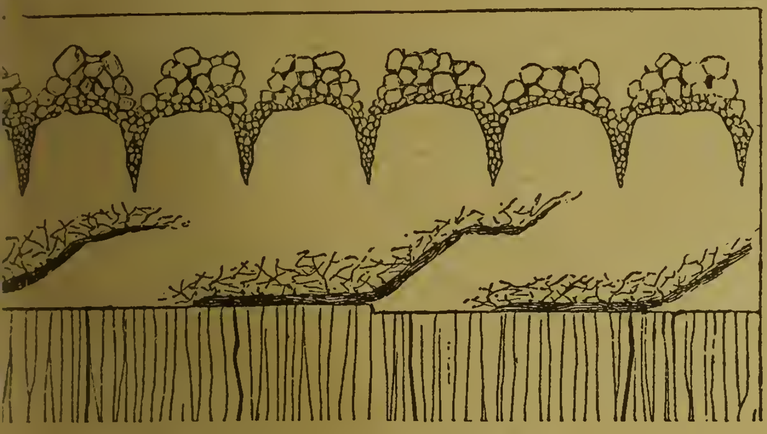

FIG. 2. AFTER USING THE PACKER.

The most important part of this soil tillage or preparation, is a thoroughly ned and well firmed stratum just beneath the surface soil, as shown in Figure

Figure 2 shows a cross-section of the same furrow as in Figure 1, after the ub-Surface Packer has been used. This has resulted in completely pulveriz- ig al lumps and clods in the bottom, as well as pressing the weeds, stubble nd manure into a thin and compact body, with soil closely firmed about it. ow, instead of this matter acting as air-duct and conveying a volume of air nderneath the plowed soil, and not only drying out all the moisture, but cutting f all possibility of supplying the plant by capillary attraction with water om below, you have this vegetable matter in the best possible condition for pid decomposition, as moisture will immediately gather in this firmed soil ound this matter. As air reaches it easily through the pores of the soil, and soon as the temperature rises to a sufficient degree from the heat of the sun, e conditions are perfect, and from this decomposition comes the most valuable ant food, nitrogen—valuable because it is hardest to get under ordinary conditions.

farmer can plant no more, but hould plow and pulverize his , prepare the soil to receive and the rainfall.

doubt many will say it is ab- to plant as I have outlined But it is just what has been by Mr. Rule on his farm first ell, from 1895 to 1902, and since on his dry farm near Anaheim.

. one twenty-acre tract in 1906 irst grew a crop of Early Rose toes, and afterward a good aver- crop of watermelons, musk- ns, casabas, sweet corn and t potatoes, and in 1907, on the e tract, he grew a crop of musk- ns, sweet potatoes, watermelons, atoes, onions and garlic. The ns were the White Bermuda. planted the seed in February and the crop in June. There is ab- tely no water available to this t. Mr. Rule knew nothing of Campbell system, but he said

ing the dry season of 1897 to 1900, as many dairymen were thus enabled to exist.

"Dry Farmer" Will Answer in Cultivator.

Dry farming is so applicable to Southern California, and a knowledge of its principles are of such great value to the large ranches in particular, that it is well worth their while to give it a little study. The writer offers to extend any aid possible by replying to inquiries on the subject or concerning any particular crop.

Address "Dry Farmer,"

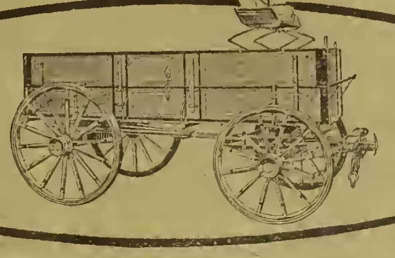
A Planting Calendar.

In the foregoing lines, having outlined a rotation of crops from December until June, the following is a continuation that could be safely followed throughout the year with proper irrigation. It is this late planting that puzzles the new man from the East:

June—Plant any kind of vine seeds, corn and beans, particularly the Kentucky Wonder Wax beans, because that variety does not rust. Plant potatoes for fall crop.

July—Plant peas, cauliflower, cabbage and new Queen onion seed. Transplant stone tomatoes and early cauliflower. In Imperial and Coachella valleys plant Mexican June corn

Continued on Page 294.



THREE HIGH CLASS FARM WAGONS

A FARM wagon has much hard work to do. It must haul heavy loads, travel over rough roads and be out in all kinds of weather. When you buy a farm wagon you want to get many years' service from it.

You will not be disappointed if you buy any one of the three wagons described below.

The 63-Year-Old Weber

The King of all farm wagons. Only the very best and most thoroughly seasoned wood is used; ironed to make a wagon that lasts a lifetime. Light running, convenient and a wagon of fine appearance.

The Popular Columbus

Built in a factory where most exacting conditions are enforced. Air seasoned wood stock, ironing which gives great strength and durability, workmanship by thorough mechanics and every part thoroughly tested.

New Bettendorf Steel Gear Wagon

Front and rear gears made of steel. Parts riveted together, not bolted. A wagon that is proof against breakdowns. Nothing can work loose or rattle, and there can be no warping, drying apart, shrinking or rotting.

You should remember above everything else that a cheap, poorly constructed wagon is dear at any price.

Before you buy any wagon call on the International local agents and learn all the superior points of the Weber, Columbus and New Bettendorf wagons. They will show you the wagons and hand you printed matter giving all particulars. Or if you prefer write nearest branch house for full information.

CITRUS FRUITS

(Oranges, Lemons, Limes, Grape Fruits, etc.) must be of good size or they fail to satisfy the market. Says an authority on this subject: "An orange that weighs a pound would sell in New York for a dime. When it takes six to weigh a pound they are worthless."

You can insure large growth by fertilizing with

Nitrate of Soda

It is the **Standard Ammoniate,** and it is the cheapest. Unlike any other ammoniate, no intervening process is necessary before the plant can take it up as food.

Wonderful results have been obtained in Florida by fertilizing during the cold season.

Directions for successful Citrus Fruit growing will be sent free upon request to all who apply. "Food for Plants," a 237-page book of useful information, will be sent free to farmers while the edition lasts, if paper is mentioned in which this advertisement is seen.

Send your name and complete address on post card.

With the Citrus Growe

STOCK FOR ORANGES.

THERE has been no definite settlement of the question of stocks for orange trees under various conditions of soil and climate, though there have been some definite results observed. Different stocks have their advocates as do all types of things with which we mortals deal. While the sweet stock is the most widely planted, it has weaknesses that render it undesirable in many locations. Lands that are not well drained should never be planted to sweet stock, as the variety is apt to become diseased if the soil for any reason gets out of order. With the exception of pomelo, it forces the rankest growth of top.

Florida sour stock is one of the most disease-resistant citrus stocks that we have. While it is the deepest rooting of all the citrus family that is used for budding purposes, it will stand wet feet better than any as far as tried in this State. It is more tender than the sweet stock as regards frost, when the trees are in the nursery, but after the first season is passed there is no apparent difference in this regard. During the early life of the tree, that on sour stock will not make as large a growth as that on sweet or pomelo, but when the trees reach maturity, there is little or no difference between the size of those on sour and sweet stock. It has been quite noticeable in many groves that trees on sour stock produce more uniform crops of fruit one year with another than do sweet-stock trees. The fruit is as high in quality and the trees withstand greater variations of conditions than do sweet-stock trees.

> I am very much pleased with the issues of the Cultivator of Januar 9th and February 13th. Both these issues are full of information an food for thought for everyone who gets his living from the soil, but pa ticularly the fruit growers.
>
> The Citrus edition is perhaps most interesting to me, as there i so much that is new in it, to the grower of deciduous fruits, although w do grow oranges and lemons for home use, even in this great wilderne of prune trees.
>
> I congratulate you upon these special issues and also upon the steady increase in quantity and quality of the reading matter that you set before your readers.—H. G. Keesling, Edenvale, Cal.

Pomelo stock makes the most rapid growth of the four kinds now in use in this State. It has the bad habit of gumming the first year after transplanting from the nursery, and many trees are lost at that time, but after this period is passed there is little trouble of this kind.

The trifoliate orange is now used to considerable extent as a budding stock. It is quite commonly supposed that commercial varieties budded on this stock will stand more frost than when budded on the other stocks. This is not the case, as trees on all four varieties of stocks growing in the same orchard and side by side showed no difference in this respect. There would be no advantage in the trifoliate or any other stock even if the trees did stand more frost, excepting during the first year. All of the commercial varieties of trees on any of the stocks will go through a harder freeze than will the fruit. The fruit will often be utterly ruined by frost and the trees will pass through uninjured. Orange trees should never be planted where frosts that will freeze the fruit are common. Aside from this argument, the trifoliate stock will not grow as large a tree as any one of the other three varieties. It is used in Jap dwarfing. It makes a large c at the base, with many variet stock making the larger grow the nursery, the newly trans trifoliata plants will make a larger growth than other va but as the trees grow olde slower growth develops.

ORANGE PUFFING AND S TING.

There has been much comm the street about the ingeniou soning on the part of the speaker at the fertilizer disc last week, to show how puffin splitting may be prevented by cious fertilizing.

We say ingenious, because w not believe the reasoning wil the test of comparison with The facts are simply this: Las there was an unusual amou splitting, probably more tha ever been experienced befor servation showed that it was entirely confined to the orchar cated on the higher slopes. was scarcely any in the grove cated under the old Riverside There seemed to be little diff in the various orchards under same exposure and location.

Again, two years ago there wa unusually large amount of puffing veloped throughout the orange g ing sections. There seems to b system of fertilizing that contr the puffing. It was more abunda on light soils than on heavy, b there was more than usual that son. Last season there was un ally little to be found anywhere, this year up to date we are singula free from it.

Now, if the fertilizer theory hold good, we must infer that spring and summer the growers the higher ground all ferti wrongly and those in the va where there were fewer splits, a ed the correct method of fertiliza But we must have all adopted the correct thing in fertilizers past two seasons to prevent puff and two years ago the method p sued by all was faulty. Now know that no such thing occur There are just as many comb tions of fertilization schemes there are five-acre pieces planted citrus culture. No two grower least, treat their groves exa alike, and yet in these re split and puffing, like results are obtained; so we must look for other cause. We give it up.—Riverside Enterprise.

COVER CROPS.

Conclusion of James Mills valu ble article.

Now, let us look at that. I ld that we got the amounts that I have stated. Compare them for a moment. You buy, say, ten pounds of complete fertilizer for every tree in your orchard. There are a hundred o the acre, a thousand trees ten acres. Ten pounds to the ould be five tons of commer-rtilizer. Five tons would be ton. That fertilizer would con-per cent. of available nitrogen, cent. of phosphoric acid, and r cent. of potash. If you want iore potash in a complete fer-you will have to pay larger If you want 5 per cent. they ut it in for you and you will r it at the rate of at least six en cents a pound for actual Four per cent. of nitrogen is nds to the acre, 80 pounds to n; 400 pounds of nitrogen to res, five tons, as compared to 400 pounds from the cover crop. e phosphoric acid, 8 per cent. pounds to the ton, or 800 unds to the five tons. I think that from one variety of cover ve had 3600 pounds of phosphor-l to ten acres, as against eight ed pounds from a commercial zer—four and one-half times as —not all available, but available h. You do not need to use as phosphoric acid; you must use You can easily get it by analyz-our crop; you can easily get it ing to the authorities and asking how much comes from a crop of r potatoes or corn or cotton, and ught to put back a little more aste, but it won't be much, and et these through the cover crop, great extent; but the nitrogen is you are after. It has been said, said truly, that for the growth ops you can get enough nitrogen the growing of cover crops, the ria taking it from the air and g it up in the crop that you grow, that you will not need to buy, your soil fertility has been re-d. if you have exhausted it, in nercial fertilizer. In fact, it is that if they had not found how to ifacture it from the atmosphere, would have to get along without ecause the available sources in e and elsewhere will be used up ur present rate of use.

a Library.

w, I think I should close. I wish you would think of this, that you d go to the authorities—get Hil-, get King, get Bailey, get Snyder, Voorhees—study them. The law-when he is asked to give an ion, goes to his library and he tell you what your legal rights But the farmer, when he is up ist a problem, stumbles along like forefathers and wonders what is matter. The matter is he is not to snuff;" he is not up to his ness; he has not read. Don't you that you need more brain power irm right than any physician, or minister, or good lawyer?

ake up! Get your library. What these men writing for us for? t are we paying them for? What Stubenrauch and Waite and others rimenting for, but for you and for For $25 we can get the result abors that have extended over a dred years and we can put it on shelves and with a little work, Elijah did a while ago, we can it and get it inside of us, and you be better farmers a hundredfold, use you have got the results of rs of wise men for many years eding you. But you go along year r year, just like the Egyptian farm-with his old plow that he used in eph's time. I mean this theoreti-y—you don't study. Go and get a library, and when this matter fronts you take down your books delve and dig, and there is not roblem that confronts you that you not solve without writing to the versity. You have no right to te to them, because they have put in print, and you can get it in usands of bulletins and you can it in the splendid scientific works t have been given us in the last tury.

Humus.

olomon said, "In all your getting, wisdom." I say to you farmers, all your getting, get humus in your l." (Great applause.)

Full Protection

The purpose of a roof is of course protection—but there's a great difference between *some* protection and *full* protection. Shingles, tin and common prepared roofings give some protection for some time, but

REX FLINTKOTE ROOFING

is the only roofing that gives *full, lasting* protection. REX not only protects against rains and snows, but against heat, cold and damp, and against the danger of fire communication by falling sparks and firebrands. REX Flintkote ROOFING is not only absolutely water-proof, but is fire-resisting, a non-conductor of heat and cold, and an impervious barrier to dampness. REX Flintkote ROOFING is made to last; its virtue is not merely in its surface-coating, but in its body. That is why imitations coated to *look like* REX do *not* give REX service. To get a roof that will give the all-around protection required by farm buildings, look for the boy trade-mark and get the genuine REX Flintkote ROOFING.

The Culture of the Onion

One of the best authorities in this State on onion culture is probably Mr. S. J. Murdock, the writer of this article. For nearly forty years he has devoted himself largely to the culture of this, one of the most popular vegetables of the United States. Mr. Murdock has not only had experience in California, but one year in New Mexico, and also experience in the Hawaiian Islands.—Ed.

THERE is one thing of paramount importance which conduces to the satisfactory results of a successful onion crop, and that is good seed, for on good seed more than any one thing, the careful grower relies, and possibly to a greater extent than that of any other vegetable, unless it be the cauliflower.

Onion seed should be of the best possible strain of the variety intended to be grown and strictly fresh, as it soon looses its vitality. An experienced person ought to be able to judge onion seed as to age and vitality by inspection—bright color indicates new seed, while heavy, plump seed gives evidence of vitality—but for pure strains of unmixed varieties the purchaser will have to rely upon the grower and dealer. High priced seed or new-named novelties it would be best to test sparingly before planting extensively. It is our experience that the novelties of the catalogues are introduced more for the benefit of the originator and dealer than the producer. Nevertheless, once in a great while the producers do get hold of something new that is a source of profit.

A FIELD OF ONION SEED.

Cheap Seed Inferior.

Cheapness in seed of any kind carries with it the stamp of inferiority. The value attached to good seed by old growers is often a source of wonder to the inexperienced and is frequently overlooked by the beginner. Poor seed has caused many a novice to quit the business in disgust, with a loss of time, patience and money.

The onion top grows 15 to 24 inches high, according to the variety and the fertility of the soil. As the onion develops and the crop begins to mature the stock or top dries or shivels up near the bulb and falls over; this forms a ripe onion; but a portion of them, according to the purity of the seed used, will remain large and stiff just above the bulb. This constitutes a scallion or stiff neck. The scallion, although good to eat, does not keep well and is unmarketable; it is an inferior product. Most all vegetables are susceptible of being bred up to a high degree of perfection and the onion is no exception to this rule. If we should grow and select seed from scallions for a few years we would soon have a strain of seed that would grow scallions to a certainty. While on the other hand, if we would select the earliest and best shaped bulbs, with small necks (the word neck is used to designate that portion of the onion top close to and just above the bulb,) to propagate our seed from and continue this careful selection from year to year, we would soon produce a strain of seed which would, with proper cultivation, grow a fine crop of well matured bulbs with a small per cent of scallions. The unscrupulous grower will sell all of his marketable product, reset his scallions, and grow a crop of more than worthless seed, whereby the purchaser not only loses the cost of same but invariably his time and labor. Experience with poor seed all goes to show the importance of selling only the very best.

Another disreputable practice among some seedmen is to buy up the seed still on the market at the close of the season, hold it over along with what they may have unsold, till another year. Seed two years old is generally very unsatisfactory to the producer planting it. Yet a crop of very plump heavy seed may be better at two years than that of a poorly matured crop of new seed.

Good, reliable seed is the keynote to success in onion culture; if we go wrong here all may be lost. Many may think that I am over particular on this point, but my past experience tells me to the contrary.

Preparing The Seed.

In the preparation of the seed bed, the work should be done thoroughly, but not too deeply, especially for an early crop. The closer we keep the roots to the surface the earlier the crop may mature. The plot should be brought to the finest state of cultivation, as smooth and level as possible and free from rubbish. The onion will succeed in a greater diversity of soil than is generally believed, but the more humus the better, as fertility is a natural adjunct to a satisfactory crop. I prefer, for a large crop of solid bulbs, a rather heavy soil, well drained, yet, for an extra early crop, would plant on rich, sandy loam. The plot should be protected from heavy winds, and avoid all shade as the onion is a lover of sunshine in all stages of growth. Well subdued and thoroughly drained muck land offers every condition of success.

Planting.

Planting is generally done with a seed drill, of which there are several patterns. I find the Planet, Jr., a re-

ol, and prefer the seed drill el hoe as separate machines ombined. I can do better specially with the wheel hoe, lighter and more open in con-, which gives the operator a iew of his work, and besides not wearing out your seed hile you are only using the oe.

should be taken to start the w straight, as following rows ged by it. Not only are regu- s the pride of the practical r, but a great help in after ion—the straighter and the ui-distant the rows the closer rator can work with the wheel he closer the work is done the nd-weeding will be necessary. ws should be from 12 to 16 apart, according to the variety the larger the variety, the the distance.

oist, heavy land, the seed be drilled just deep enough to over. The lighter and looser the deeper the seed should ted to prevent drying out be- iking root. If the soil is in condition to work, the firmer it d the better. The right time the seed varies with different s. To cover the entire year I own onion seed every month ve been very successful in ma- my crops. However, the crop arvested at regular periods as ires warm, dry weather to ma- onion crop.

varieties: For early market w Queen and White Bermuda st for this section, while the Reds are the main early crop Fraucisco market.

ormer I consider the best early if properly grown. It is a white onion and a good ship- is a quick grower, a fair yield- best selling onion I ever put market. When I first put this n the market I could scarcely buyer, but when its superior s became better known, the ave it the preference over all For later crop the Australian is the leading variety; is a lder and the best keeper and , while the Yellow Denver is second.

to Sow.

the seed in September or Oc- uite thick, on a well prepared ed, and when the plants are x to eight inches high, pull up nsplant on well cultivated and hly cleaned plot of ground in 2 inches apart and plants three apart in the rows. I always the tops so as to leave a stub three inches long, and think er to trim the fine roots some s it makes the transplanting and lets the soil pack closer the plant.

onion seed sold the last two or ears as White Italian, New Sil- in and New Queen in many did not prove to be true to hence great dissatisfaction. omplaint was very general. For rly varieties plant sets or sow from the 10th of September to r the 20th.

late crops sow seed February r as soon as possible after that If sown much earlier there likely to be a larger percent- scallions, also more hand-weed- On the other hand, if delayed g the yield will be perceptibly r. Put the rows 12 to 15 inches and sow from four to five per acre. After seeding, thorough, shallow cultivation is essential. Do not wait until the plants are up before beginning; from four to eight days will be proper, or when the seed begins to show signs of germinating, which can be ascertained by carefully brushing the soil from the drill row. I put the curved hoes on my wheel hoe, with the straight ends of the hoes pointing inwards and lapping about two inches, and hoe right over the rows, but not deep enough to disturb the seed. Right here, and in the after cultivation, will be seen the necessity of bringing the ground to the finest condition possible.

I find that it saves a great amount of hand-weeding by killing the weeds just starting to grow in the rows. When the onions are up sufficiently to follow the rows, I reverse hoes, with the curved ends next to the rows and just far enough apart so as to hoe as close as possible without cutting the young plants, by running the hoes astride the rows. This operation hoes both sides of the rows at one trip of the machine. Follow this by hand-weeding; this operation is best performed by the crawling process—that is, by getting down on hands and knees astride of the row and pulling every weed in sight and loosening the soil around and between the plants; repeat this as often as any weeds are to be found, and under no circumstances allow the weeds to grow above the onions; at the same time keep the wheel hoe at work between the rows and as close as possible.

Harvesting.

When the tops have turned yellow and dried or shriveled up near the bulbs, and the majority have fallen over, the crop is ripe and ready to harvest. If on moist land they should be harvested at once, for if left long in the ground the moisture from below and heavy fogs will soon cause them to start new roots. On dry land, however, the summer crop can remain quite awhile without injury.

Harvesting a mature crop is done by pulling two or more rows; lay the onions next to the standing rows, and when across the plot turn round and pull a number of like rows and lay with the ones previously pulled. This leaves them in a continuous pile across the field, when they are in a convenient shape to top, which is generally done with a sharp knife, after having lain a few days to more fully mature. While topping the bulbs are usually thrown in heaps ready for market or to store away, as the grower may determine. It is best to sack and haul from the field while the sun shines, as the onions

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

California Grown See

Many people know in a general way that California is something of a fa flower and vegetable seed production, but we are glad to give our readers a idea by giving the following article written by Mr. Lester L. Morse, of the Seed Company. Mr. Morse is directly connected with this great industry, an a pleasure to read his short account as it is entirely authentic.—Ed.

WHILE garden and flower seeds are grown in a great many locations in various parts of of the world, there are but a few sections where the industry assumes any great commercial proportions. The American seed houses still import large quantities of beet, carrot, turnip, cabbage and most of the miscellaneous varieties of flower seeds. The Middle West produces most of the sweet corn, melons and cucumbers.

But California holds practically a monoply in the production of onions, lettuce and sweet peas, and is an important factor in competiting with Europe in celery, endive, leek, parsley, parsnips, radish, salsify and some of the more important flower seeds such as asters, cosmos, poppy, eschseholtzia and verbena.

A Specialty.

The business of growing seed is a very complicated one and calls for skill practically professional in its operation. It is also a very expensive system of intense farming, and the capital required and the detail involved serve to deter many from the business.

Three Selections.

In California, seed growing, excepting beans and peas, is confined almost wholly to three localities: Gardena in Southern California; Arroyo Grande Valley and Santa Clara valley.

The largest operations are confined to the Santa Clara valley, in the vicinity of San Jose and Gilroy, where about five thousand acres are devoted to the growing of the seeds above mentioned, and which have become known in the seed trade as the California seeds.

One firm alone in the South Santa Clara valley at Gilroy operate two thousand acres under their own direct management, besides their large areas of peas and beans, which are grown for them by farmers in Humbolt county and Lompoc, Santa Barbara county.

The Coast Line railway runs through one of Morse & Co.'s farms, and the long strips of sweet peas, lettuce, onions and carrots makes a good display during the months of May and June.

The plowing is now all done dry with traction engines, during the fall. Then as soon as the rains come all the teams and all the force are busy planting. The onions are set out by hand, right side up in rows three feet apart and about 50 sacks or centals to the acre. Planting onions begins about Nov. 1st and lasts till Jan. 1st. All the crops are supposed to be planted by the middle of February, and then the hoeing and cultivating begins and lasts to about June 1st. The earlier crops begin to ripen about the middle of July and then the harvest season continues uninterruptedly until the rains set in about Nov. 1st.

A seed grower's harvesting outfit is one of the greatest investments. Morse & Co. use three large mounted gasoline engines, two oil burning field steam engines, three specially constructed onion seed threshers and separators, two very large specially built radish separators, two large sweet pea separators, two specially built cucumber separator operated by engines.

Some crops such as lettuce celery, cannot be threshed by chine, and are flailed out by

Seasons Favorable.

There are no cold winters w and the seed grower works the whole year round. He one thing or another for six m of the year and he harvests his from June to November. His are greatly diversified, and e thing is grown in great var Morse & Co. operate extensive and experiment grounds on seed farms where everything grow or buy is tested, and w many new varieties are dev and improved. Fully thirty sweet peas, alone have been covered on their farms and so original introduction. New let new onions and several other tant novelities have been dev here.

Under the Blue Vault.

While practically every other growing section in the worl quires a great many sheds and ings for caring and harvesting seed, this work in California is done out of doors. Thousand yards of duck or drilling are m into the sheets or drying cloths, after the seed is cut it is cured these cloths, right on the land wh the crop has been grown. Here is threshed and roughly sifted, t taken to the cleaning houses to recleaned and put in merchanta condition and shipped away. M of the crop is contracted before it planted, this proving to be the saf manner of handling seed cro

The selection of the plants roots, the care exercised in for the crop, the intelligent m used in development work and eral treatment, all determine th quality of the seed grower's All California seeds are not of form quality by any means, none know this better than the American seed houses throug the United States and Canada.

A FAIR SPRAYING PROPOSITI

Test is the strongest argu When a reputable firm like the Mfg. Co., of Canton, Ohio, off send a choice of three different s ers with no money in advanc means that there is value and h in the proposition. You can try o their sprayers for ten days and if you buy you can pay the ca they will wait until you sell your

The Fitz-All Barrel Sprayer fits barrel or tank. Has special h working parts, which will last a time.

It can also be turned over a tree-sprayer in five minutes frame is made of steel and working parts are brass It is ed on a Hollow-steel-frame wheelbarrow, and pushes easil cause it is well balanced.

The Hurst-Power Potato and chard Sprayer is a powerful m developing high pressure. It with either 60 or 100 gallon t one or two horses. Has steel f and axle with powerful pump w develops as high as 200 pounds p sure.

All these sprayers are protect a five-year guarantee, and, as they in their advertisements, "You our Machine with your money in pockets." There are no strings t offer. Their new free catalogue w sent to every applicant. It de their spraying machines and e how one can get a Hurst Sprayer It contains their agreement by wh any farmer or fruit grower can their machines "without sending cent."

TO PLOW UNDER GREEN STUFF.

is the time to plow under crops in the citrus orchards. lowing is attended with many tles some seasons and some good is lost which with early plowing would be a decided gain. If rains stop for the season in March, as they did last year, it will be difficult to get the land in shape and it will be impossible without irrigation. At this season of the year no time when the land is in propert condition to plow should be allowed to pass without turning it over. About the middle of March will be army worm time and if the season is favorable for them, the green stuff in the orchards will attract the millers which will lay the eggs in the green stuff.

A new introduction worth planting more extensively.

TO MAKE HARNESS LAST.

Harness oil serves an important purpose in stable economy.

It is one of those little things that mean a great deal when profit and loss accounts are balanced up.

Everyone knows how a water-soaked shoe hardens, and how much more liable it is to crack or wear through when in that condition.

It is just so with a harness. The leather and making may be the best, but contiual use in all weathers—wind, rain, sun and cold— tend to harden and dry out the leather and leave it without "life" or elasticity. Just at this point the destruction of the harness begins, because the open pores in the leather readily absorb moisture and animal sweat and decay at once sets in.

If a harness is kept soft—the pores filled with Eureka Harness Oil—it will go through daily service under the most trying weather conditions and last very much longer than it otherwise would.

"Eureka" is a heavy bodied oil made especially for treating harness. There are no acids or anything whatever in it that can injure leather, but it does contain elements that are positively beneficial.

When a harness is cleaned, an application of Eureka Oil makes it pliable—soft as a glove, tough as new leather. In point of fact—barring wear on the stitching—just as good for looks and actual service as a new harness.

Apricots in bloom all over the southern part of the State indicate a fair crop if weather remains favorable.

Pulling Vines.

I would like some information as to the best way to rid twenty acres of diseased wine grapes. They are not dead, but do not bear fruit. If pulling up is best, kindly explain best way. If chopped off a foot below the ground would they cause much annoyance later? I intend to plant an orchard on this spot.—Edward Melone, Stockton,.

No, do not cut off below surface. They will be an exasperation and trial to you for years with their suckering. The writer with one helper and team cleared many acres years ago with the following simple device, very quickly and easily:

The rear part of the farm wagon, wheels, axle and hounds are taken and in place of the reach a 3x4 or 4x4 straight grained piece of Oregon pine, say, 14 feet long, is bolted. The principal projection is forward, and the projection to the rear is about even with the rim of the wheels. That is, when the front end of the pine piece is elevated and it stands perpendicularly, the short, rear end just touches the ground.

Clamped to the short end should be a stout hook to which a stout, short chain is hooked after being thrown a couple of times about the vine.

A few shovels of dirt should be taken away from the crown of the vine so as to get as low a hitch as possible, for sometimes the vine will snap off if hitched too high. Now, when the chain is firmly attached and with the long end of your "reach" or "lever" is up in the air, the team which is connected with the long end by a rope, say, 40 or 50 feet long is started, and, if the ground is moist and soft, the vine is popped up out of the ground with nearly all the roots attached. At least, there was scarcely ever enough left to sucker.

As your team settles down and learns the work soon, it will usuaully stop, after the vine is pulled, so that the axle is about over the next vine to be pulled, the chain is quickly attached, it is pulled, and so on across the field on the same row on which you started. Then turn around and come back on the next row.

The slight cost of rope, blacksmith's work, etc., is more than made up on the first day's work, over any other plan we ever saw.

Helpful Hints.

Of course you give the right time to plant flowers and garden for your locality, but we have to plant much later here on account of frost. I get a good many useful hints out of the Cultivator and am always glad to see it come.—J. R. Baker, Healdsburg.

To be sure, California has many kinds of climate and diverse conditions. A grower must use his judgment in whatever locality he may be.

Birds.

Please let me know in queries and replies column of the Cultivator what can I soak my seed corn with to keep the birds from taking it up. They dig down and pick out the kernel as soon as the young shoots appear.—Subscriber, Anaheim.

rs and Johnson Grass.

ave received many good things the Cultivator, especially from ueries Department. I now send mite.

t, as to Johnson grass which I n enquirer asks about. I can thize with him. I poured com-coal oil on each plant when it red above the surface and fi-got rid of it all. It took a long but I succeeded finally.

gophers I used Wakeley's pois-wheat, using the same amount od wheat with the poisoned t. I also use carrots and strych-Cut carrots in small pieces, small sharp stick, which is first into the carrot, then with mois-of the carrot still on it, dip in rized poison and put it back in hole in carrot. Do this several . Put poisoned pieces in gopher and cover.—B. J. Carr, Lodi.

hope Mr. Carr will come again.

Dates.

Kindly inform me through the Cultivator if dates can be grown from seed; if so, what is the manner of propagation. I have some seeds which I put in water and they are sprouting. Is tree anything like date palm.

What is gypsum? What is the effect of gypsum on black alkali soil? Where can I obtain some? How much does it cost per ton?—D. F. C., Lemoore.

You can grow palms from the date seed, but they will probably not fruit, or, at least, not give you a good quality of fruit. The government and individual growers in Arizona and Southern California have gone to great expense to introduce from Algeria suckers from the various varieties of dates. When grown from suckers they are, of course, true to name. It is a palm, Phoenix dactylifera, and of very slow growth; much slower than Phoenix canariensis or so-called "date palm" ordinarily seen in our yards.

Gypsum answer next week.

Alcohol.

Please tell me where I can secure the alcohol spoken of in your article a couple of weeks since.—Mrs. K. H.

It is necessary as yet to buy of the drug store. Later, as its manufacture extends, as many hope it will, it will probably become a regularly handled product at all the merchants.

A Gopher Nuisance.

Is there now a law to handle the man who is so shiftless that he can not see the damage the gophers are doing on his own place, but makes no effort to get rid of them, allowing them to increase in numbers so that they continually stock his neighbor's place, causing the neighbor a large amount of damage and continual expense to keep them down?—W R., Hemet.

We do not think there is any such specific law, but the general law which prevents a man from maintaining a nuisance will probably be effective. Apply to your Horticultural Commission. It has the power to abate the scale nuisance, it should also have power to abate the gopher nuisance.

Water Right.

A has an orchard through which a creek formerly ran, or runs. Said creek only runs by heavy rains or freshet, and practically spreads over his entire orchard thereby irrigating same, but as it frequently happened, that he received more water therefrom than he wanted, he diverted said stream by digging a ditch along one side of said orchard, along a county road. Said ditch was made by permission and assistance of County Supervisors and is constructed four feet on the county road and four feet on land of said party, A. Said party, A, thereafter used as much of said creek water for irrigating his orchard as he saw fit by using a side ditch and by openings made along the banks of said creek or ditch, but did not make any filings on said water for irrigating purposes.

Subsequently, or after the creek or ditch had been made along the road, parties B, C and D made filings on the water of said ditch for irrigating purposes, and diverting said water from said creek or ditch through a side ditch to lands of their own, said point where water is diverted to lands of B, C and D, is at a point in said creek or ditch after the water has passed over or by said land of A who has the first right to the use of said water, Party A or parties B, C and D? A Subscriber, San Jose.

A certainly has the first right to the use of the water. That portion which passes over his land is his to use and to do with it as he sees best. B, C and D would probably be entitled to the use of any water left over and running through the ditch after it leaves A's portion of the ditch.

Onions in the Coachella Valley

Mr. A. W. McGill, of Coachella, who writes the article below, is one of the pioneers of onion culture of that valley. His claim as to the profitableness of onion culture may seem fabulous, but we believe the regular who stands by onions year in and year out will win success.—Ed.

THE growing of Bermuda onions commenced in this valley in 1905. The writer obtained 50 cents worth of seed from Atlanta, Georgia, which was sowed on a small plot of ground and then reset in November, four inches apart in row, and rows 16 inches apart, with small irrigating furrows between every other row.

They grew remarkable well, and the following years there was planted about four acres, and I used the same method in growing that crop. First, I sowed the seed the first of September on a small plot of ground; when about the size of a lead pencil, I transplanted in rows as above. Kept the ground fairly well cultivated and irrigated about every ten days, and sold 35 tons of good marketable onions. One carload I sold f. o. b., which brought $542.00. Last season the valley produced about 50 carloads, and it looks like there would be 200 carloads sent out this coming season. Some planters here sow the seed in the field the required distance apart then thin to a stand. But the Texas growers prefer transplanting; while it is little more expensive the results are more satisfactory, and I find the best growers here prefer transplanting. The possibilities of this one crop cannot well be overestimated as a winter crop and a money paying one for this section of California, as the soil is well adapted to the culture of the Bermuda onion, and it would not surprise me to see 500 carloads go out of here as a yearly crop. They are good keepers, good flavored and look well on the market.

To all growers of this crop I would say: Get only first class seed and that fresh. Onion seed over two years old is absolutely worthless and over one year old has lost a great deal of its strength. By getting good seed one can count on a first class crop. The year I raised 35 tons every onion was marketable, no scullion or seed top. I look to see some acres this year produce $600 of good marketable onions. Which is saying a great deal for this soil that never had any commercial fertilizers.

ONION CULTURE IN CALIFORNIA.

Continued from Page 289.

should be perfectly dry in either case.

The yield per acre differs with different varieties, under different circumstances and on varied soils. Two hundred centals is a fair yield of the smaller varieties, yet it is not uncommon to raise three to four hundred centals per acre, and I know of one instance (which is certified to by witnesses,) of one single acre yielding 660 centals, and that, I am proud to say, was done on California soil.

Like The Mercury Back East.

The price and profits are about as variable as the mercury is in the Eastern States during the month of April. I have seen them a drug on the market at thirty cents per cental, while within six months I have known them to be in demand at $10 per cental, and have sold in the city of Los Angeles 100 sacks of early onions for $500. I I have never seen a year in this State, and have been a resident for the past thirty-seven years, but that onions have sold for $3 or more per cental, wholesale. I have grown onions more or less since 12 years of age and have found the business a profitable one; but let no one suppose that success can be attained otherwise than by steady personal application. A great mistake with many is to attempt too much at the start. Without the necessary experience and insufficient help, failure, or at best, but a partial success is the result.

In conclusion let me impress on the minds of those new to the business, be very careful in the purchase of your seed and do not attempt too much at the start.

A GOOD SHEEP DIP.

The West Coast Creosol Dip is said to be a most effective remedy for sheep scabies. It is a strong and effective germ destroyer, wool is really improved in texture by its use.

It is manufactured by the West Coast Stock Food Co., 818 San Fernando St., Los Angeles. Write for "special price freight prepaid."

and blackeye beans, and transplant the stone tomatoes for fall shippers. Plant California Pearl cauliflower seed and large late Adams corn for roasting ears.

August—Transplant stone tomatoes and cauliflower, and plant fall potatoes, blackeye beans, peas, string beans; the variety according to your locality; Queen onion and early fall cabbage seed.

September—Plant crops for green manuring; vetch, blue and white peas, fenugreek and burr clover. Sow Winningstadt cabbage seed for the shipping crop; white Bermuda onion in the Coachella and Imperial valleys, but always the Queen nearer the coast. Plant Yorkshire Hero and Wiltfong peas, Canadian Wonder and the Ventura Wonder beans, Wonderful lettuce, winter spinach, beets, carrots, parsnips, salsify and winter radishes.

Spray your tomatoes with Bordeaux mixture.

October and November—Plant wheat, oats, barley, alfalfa, vetch, fenugreek, burr colver, blue and white peas. In frostless sections plant Canadian Wonder beans and Yorkshire Hero peas.

Spray your tomatoes with Bordeaux mixture. Transplant Winningstadt cabbage.

A THOUSAND INCUBATORS IN A WEEK.

The Petaluma Incubator Co. recently beat its own record when it shipped out a total of a thousand incubators in one week. This is because of a little business hustle and liberal advertising of the management.

A local paper speaking of the firm says:

Local poultrymen have almost stood in line waiting for the varnish to dry on the machines in order to get the home have actually taken machines some have actually taken amchines away while the varnish would stick to their hands. Is it any wonder that the erection of a new factory is contemplated. Had it not been for the fact of employing a large force of mechanics during the summer season and accumulating a large quantity of goods in warehouse the demand could hardly have been supplied. The Petaluma Incubator Company is certainly reaping the reward of its optimism.

Vegetables in the North

Written especially for the California Cultivator.
BY JOHN ISAAC, SACRAMENTO.

VEGETABLE growing in Northern California is almost entirely in the hands of the Italians and Chinese. During the past few years the latter have been almost wholly replaced by the Italians who are becoming the sole producers of vegetables for the city markets.

Except for the home gardens, which are cultivated for relaxation and amusement, vegetable gardening does not appeal to Americans. It requires daily attention, hard work and close application; this, together with the necessity of marketing the product after it is grown, has turned the attention of the more intelligent American to other forms of production, and he has taken to fruit growing, and like wholesale lines, leaving the more strenuous labor of the vegetable or truck garden to foreigners. This is true only in regard to growing vegetables for the family market, and does not hold good where any form of vegetable can be grown and shipped in large quantities, and in Northern California there are enormous areas devoted to some one specialty. As in the South, celery has become a great specialty, so in the North asparagus growing, canning and shipping is carried on on an enormous scale. The Hickmott Asparagus Company have one single patch of this vegetable covering 1200 acres, while other bodies of somewhat lesser size are common along the Sacramento and San Joaquin rivers.

Asparagus requires a deep, rich alluvial soil, with plenty of moisture, and the ground cannot be too rich for it. These conditions are found in perfection in the islands of the great California rivers. These have been formed by sedimentary deposits of ages, forming a practical delta. The soil contains all its virgin richness and is of unknown depth. It is ideal for the uses to which it has been put, and the annual output is enormous. So great is this that is has in a few years placed California at the head of the asparagus producing sections, and our products in this line are found in every quarter of the globe. The value of canned vegetables shipped from this State will range close to three-quarters of a million yearly, a greater part of which is for asparagus.

While asparagus is the principal vegetable grown for canning and shipping, an effort has been made to grow rhubarb on a large scale, and some success has resulted from this, although it is yet in the experimental stage. As this can be produced very early in this State and can be got into the eastern market long before that grown in the East, there is no reason why it, too, should not become an article of importanc among our farm productions. It requires very much similar soil and conditions with the asparagus, and these can be found over a large portion of Northern California.

Tomatoes, which perhaps should rather be classed as a fruit than a vegetable, are also grown in large quantities for canning purposes, sometimes in bodies of several hundred acres in extent. Our early and long seasons make the growth of this plant much more profitable and easy than in the East. Here it is in bearing before it can be set in the open in the East, and it continues to bear after the early frosts have killed off the eastern crop. Growers usually contract their crops to the canners at the commencement of the season, often contracting to plant and care for a named number of acres, the canneries agreeing to take the product at a given price. Tomatoes with us are unusually prolific and are generally a good money crop. They are subject to several diseases, however, which sometimes reduces the profits, and of these anthracnose is the worst.

Peas are another crop which is grown to a great extent in the counties around the bay for the canneries. These are also grown in large tracts, but not in such large bodies as either asparagus or tomatoes. They are generally grown under contract.

Cucumbers and other vegetables for pickling are grown also on the contract principle and sometimes in large bodies, fields of forty to eighty acres sometimes being planted to this vegetable alone.

Potatoes, of course, figure among the more important vegetable products of the central and northern counties. These, as a rule, are not grown as specialties, but as a general field crop, and each farmer plants as in his judgment the market may demand. Last season there was a great shortage of potatoes in the market and the price went beyond all reason, two to two and a half dollars per cental were commanded early in the season, and later on as much as eight cents per pound became the retail price. These prices set farmers to planting potatoes last spring and in consequence prices this season are much lower. The chief market for these is found in our own cities, the mining districts of the coast, but large quantities are shipped from San Francisco to Central and South America and the islands.

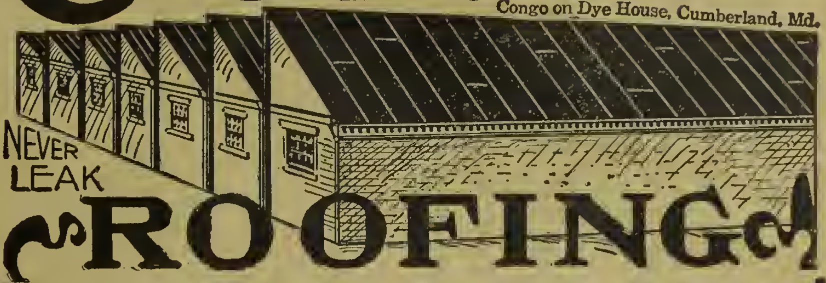
Onions are another vegetable crop which sometimes becomes important. Large quantities of these are shipped from the northern part of the State to Australia, in the season, Australia often returning the compliment by shipping onions of her production later on, when ours are gone. The onion is very difficult to keep, especially in climates like ours and that of Australia, and as the two seasons are exactly opposite, each has good onions when the other has none. Onions do exceedingly well with us and are a paying crop.

Beans are very extensively grown, and while Ventura still holds the honor of being the bean center of the State, very large quantities are now being grown in other sections, and this crop is steadily growing in favor as a field crop. Very large sections of Sacramento, San Joaquin, Alameda and other of the northern counties are now being devoted to the growing of beans, and it has been found to be a paying crop. The Lima is still the favorite as a money maker, but the crop is not confined to this variety.

Beets, of course, are grown in very large tracts, but for sugar chiefly, and under contract to the sugar factories.

These are the principal vegetables which are grown as field crops in Northern California. As stated above, the vegetable market is supplied by regular market gardeners and these are usually either Chinese or Italians. On the wholesale scale the crops are grown by American farmers with such help as they can command.

The open winters, long warm seasons and abundant moisture make the production of vegetables in this State comparatively easy and profitable; the great drawback is in the lack of sufficient and proper help in planting and harvesting the crop.



CONGO

Congo on Dye House, Cumberland, Md.

Do any of your buildings need roofing. If they do, let us send you a sample of Congo Roofing.

We call it the "Never-Leak" Ready Roofing, it is so perfectly made and so thoroughly tested.

And not only is it free from leaks, but it will not rot, or shrink or change its condition, no matter what the climate or weather.

FREE SAMPLE

Write for a sample—that's the best way; and remember, Congo Samples are not special pieces prepared for the purpose, but are cut from our regular stock.

We mention this because Congo is so attractive looking, so tough and pliable, that people sometimes think the samples must be specially prepared.

Great Bargain in Fine Land

The Big Field Ranch in Kern County is being colonized and is now on sale at the low price of $25 per acre, 1-4 cash.

It lies in the heart of activity in the San Joaquin Valley, a broad area of perfectly level land, consisting of rich sediment.

This land has an inexhaustible supply of artesian water, and is fully equal in productiveness to any land in California, regardless of price.

Suitable for grapes, alfalfa, peaches, grain, sugar beets, dairying, etc.

Unquestionably the greatest snap in high class land ever offered in the State. Excursions leave Los Angeles every few days. Call or write for maps, booklets and full information. Do not delay. Do not locate anywhere without seeing this magnificent property.

7000 acres have been sold to practical farmers. 5000 acres will be under cultivation this season.

Percy H. Clark Co.

Smith's Power Sprayer

Built in Los Angeles to meet requirements of Southern California ranchers. 1¾ H. P. Lambert Engine, ample power for all the nozzles you can use. 240-gallon Tank with mechanical agitator. Outfit complete in every particular.

"The spraying machine you people put out, is one of the best I have ever handled, and the engine works to perfection. I have worked several different kinds, but this is the best."

C. E. Martinelli,
Watsonville, Cal.

"MONARCH"

Hand Sprayers

are not expensive and can be used over large acreage to excellent advantage with but little labor. They may be mounted on light wagons with one or more barrels of spray liquid and for vegetable or field crops, numerous nozzles can be arranged to cover two to six rows at one time. With a driver and a boy to pump, 15 to 25 Acres can be easily covered in a day.

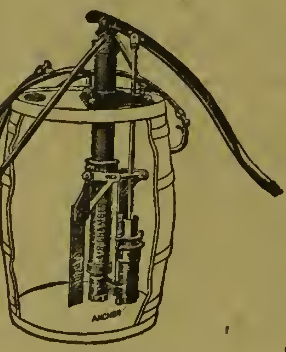
We stock a large line of Hand Sprayers, from
$3.25 to $24.00

As well as a variety of ***Spray Nozzles*** and a special grade of ***High Pressure Spray Hose.***

Tell us the kind of crops you wish to spray and extent of your acreage. We will quote price on a complete outfit suitable for your requirements —it will cost you nothing.

The "Monarch" is a high grade sprayer with two outside packed bronze plungers, bronze valves and fitted for two leads of hose. It is suitable for all kinds of spraying, cold water painting and whitewashing. The air chamber is large and the lever long making the labor light.

We carry it in two sizes: 2-in. cylinders, 3-4-in. suction; 2 1-2-in. cylinders, 1-in. suction.



"POMONA"

The "Pomona" is a most popular Sprayer as all the working parts are inside the barrel. The plunger, Gland, Valves and all working parts are bronze. The air chamber is large and the agitator most effective, operating with each stroke of the lever. It is fitted for two leads of hose.

The "Standard" is Double-Acting and an excellent Sprayer fitted for two leads of hose, but is less expensive than the Monarch and Pomona. The cylinder is 3-in. diameter, brass lined, plunger brass encased and brass valves.

Formulas for Spraying

SPRAYING THE GARDEN.

THE spray pump is a factor in garden making and, year by year more of a factor. The gardener must take this into account in his making ready for his work. Insects of all kinds, and fungi as numberless, are before him. Some may be reached by sprays, some not.

But one thing to be borne in mind, is that various washes used in spraying are for various purposes. Only recently a gentleman having a few trees on a lot called at this office to learn why the Bordeaux mixture had not killed the scale on his trees, having no other idea than that that wash was good for everything. While, as a matter of fact, it is not an insecticide at all.

There are two classes of washes used on insects. Those which kill by contact, and those which kill by carrying a poison to the plant which kill the insect when it eats of it.

The contact insecticide is used on all sucking insects, which get their nourishment by inserting a sucking tube through the bark and living on the juices of the plant. In this class of insects are the scale, aphis and others.

The cabbage worms, cutworms, grass hoppers and a thousand-and-one others which crawl around and chew up things (or, as our scientific friends would say, belong to the mandibulate class) are reached by the poisons.

Then, besides these two classes of insects, the gardener or orchardist must contend with a vast family of vegetable parasites or fungi—scab, molds, mildews, blight, etc. These are handled by another class of sprays called fungicides.

Sometimes washes like the sulphur, lime and salt wash, also the Bordeaux when Paris green is added, are insecticide and fungicide combined, but the sprayer must keep in mind the pest to be reached, and use his wash and his effort to the best advantage.

Fumigation has its place, but requires more extended space than is at command on this page. Besides, it is more the work of the specialist.

CONTACT INSECTICIDES.

First, I will give one of good old-time-contact insecticides, which was used years ago and a better has never been produced, but owing to its cost and difficulty in cooking and mixing, is now seldom used. It is the

Rosin Wash.

Caustic Soda (70 per cent)	7 pounds
Rosin	20 pounds
Fish Oil	3 pints
Water, to make	100 gallons

Place the rosin, caustic soda and fish oil in a boiler, pour over them about 20 gallons of water and cook thoroughly over a brisk fire for three hours, then add hot water, a little occasionally and stir well until diluted to 50 gallons of hot solution. Place this in the spray tank and add cold water to make the necessary amount. Never add cold water when cooking.

Kerosene Emulsion.

Another old-time and effective remedy is the whaleoil soap and kerosene, good for all scale and plant lice pests.

Whaleoil soap, or Hard soap (chipped)	1-2 lb.
Water	1 gal.
Kerosene	2 gals.

Whaleoil soap is to be preferred, but ordinary laundry soap may be used. Dissolve in one gallon of boiling water and while soap solution is boiling hot, pour into it, away from the fire, two gallons of kerosene. Commence agitation immediately, with a force pump, pumping the liquid back into itself until a thick, creamy mass is obtained. If the emulsion does not form within 10 or 15 minutes the whole may be reheated to the boiling point over a fire out of doors. The time necessary for emulsifying depends upon the quantity of mixture made, and if the proportions given are multiplied several times, the period of agitation must be continued longer. No free oil should appear on the surface when the mixture is completed.

Soft, clean water should be used from which all dirt particles have been removed, otherwise they will become centers for the collection of free oil. If only hard water is available, it should be "broken" with lye before being used. Dilute the emulsion obtained from the above formula with 27 gallons of water, or nine parts of water to one part of the emulsion for scale insects; for plant lice it may be diluted twice as much. If the emulsion is well made it can be kept for a long time as a stock preparation in closed jars. For tender plants dilution should be one part of the emulsion to 15 or 20 of water.

Kerosene sprays of any description should not be allowed to collect about the base of the tree or in the crowns of the plants to which they are applied. It is sometimes best to bank the trees with earth before spraying and should the earth become saturated with kerosene remove it from contact with the tree within an hour or two after the application is made.

Kerosene or Distillate Mixture.

Kerosene mixture—that is, kerosene or distillate held in water by being violently mixed or stirred in the water while being sprayed, is not always successful. It must at least be very carefully applied or injury or death to plant will result. One-half to two gallons of distillate to 100 gallons of water, according to kind and condition of plant.

Sulphur, Lime and Salt Wash.

The S. L. and S. wash is seldom used in the garden, but as one of the old-time scale remedies, is well worth a place here.

This wash is for application on deciduous trees when they are dormant:

Lime	40 pounds
Sulphur	20 pounds
Salt	15 pounds
Water, to make	60 gallons

Boil 10 pounds of lime and 20 pounds of sulphur in 20 gallons of water for from one and one-half to two hours, or until the mixture is a deep amber color, which will indicate that the sulphur is dissolved. The balance of the lime, 30 pounds, should then be slaked in another vessel and the salt added to this latter mixture. This should be stirred until the salt is dissolved and then added to the original mixture of lime and sulphur, and the whole boiled for from thirty to forty-five minutes longer, enough water being added to

:ors? If Not, Do So

akes a File Valuable
These Two Pages

ng the total amount of material up 60 gallons. Next strain the mate- l into the spray tank and apply to trees hot. Do not let the mate- l get cold, for the portion of the gredients will then crystallize and ecipitate out of the liquid, and its ectiveness is much reduced.

ap and Tobacco.

Dissolve 8 pounds of the best soap 12 gallons of rain water, and when d, add 1 gallon of strong tobacco uor.

bacco.

'obacco decoction is made by boil- one pound of stems or of dust in or two gallons of water until a k brown liquid is obtained. When ling is finished, add water to ke two or three gallons of solu- n; efficiency of the spray will be reased by adding one pound of aleoil soap to every fifty gallons decoction. The solution will not m the tenderest foliage, and is ef- tive against plant lice.

p Solution.

Ordinary laundry soap, a half of a und dissolved in five gallons of water will kill nearly all the nt lice, red spider and softer lied insects. Even on young black le of the orange it is effective. Ap- while hot.

t Water.

Hot water can be used with safety cabbage worms and works satis- torily.

ach.

uhach, if fresh, on house plants ally proves effective on lice, red der, etc. It also works with s, fleas and other household pests.

POISON INSECTICIDES.

f course some of the above con- t insecticides work satisfactorily the other class of insects, that is "chewers" or mandibulates, but y are easier reached by poisons, ch they eat and take into their em, some of which are remark- y effective. Arsenic and its com- nds form the base of many of se poisons.

is Green.

s a spray use 1 pound to 200 gal- s of water. Keep well stirred so t the poison shall be held in sus- sion. If this is neglected the n will settle to the bottom of vessel, as it is not soluble in er, and the result will be that spray will contain little poison first and too much towards the . In spraying stone fruits use mixture more dilute, 1 pound of on to 300 gallons of water.

don Purple.

ondon purple is seldom used ow- to the uncertainty of its purity, eing more liable to injure plants. same strength as Paris green.

te Hellebore.

sed as a spray. One ounce of the on to two or three gallons of er. When applied dry it is sel- mixed with anything. A little r, however, makes it more adhe-

nite of Lime.

his insecticide is coming more in- popular favor yearly, and is thy of it, but it is not safe to be l alone. Arsenite of lime is at t one-half cheaper than Paris n, is equally efficient, and will burn the tenderest foliage at the ngth ordinarily applied, when l in Bordeaux. To make 800 gal- of spraying mixture:

Soda	8 lbs.
er	2 gals.
te Arsenite	2 lbs.

oil all together for 15 minutes, or till the arsenite dissolves. One pint of this stock solution and 2 pounds of slaked lime, added to a barrel of water is equal in insecticide value to 1-4 pound Paris green, and costs half as much.

Arsenite of Lead.

One to five pounds per 100 gallons. It does not burn the foliage.

Another for arsenate of lead:

4 ounces arsenate of soda)50 per cent strength); 11 ounces acetate of lead; 150 gallons water.

Put the arsenate of soda in 2 quarts of water in a wooden pail, and the acetate of lead in four quarts of water in another wooden pail. When both are dissolved, mix with the rest of the water. Warm water in the pails will hasten the process. For the Elm-leaf beetle use 25 instead of 150 gallons of water.

FUNGICIDES.

The greatest of all the fungicides is, of course, the Bordeaux. Yet there are others which have accomplishd much. The mildews, molds, rusts and other troubles are most perplexing and after once apparent on plant or tree little can be done for them. In other words, funguous diseases are emphatic examples of the "ounce of prevention" theory. Once the eye sees the fungus the damage is largely done, or at least, the disease is so established that no remedy is strong enough to reach it. One preventive measure is fire. That is, burn weeds, rubbish, old vines and everything which may harbor the pest. Then use a fungicide before the trouble, which is expected appears.

Bordeaux.

The Bordeaux mixture varies greatly. Some will use 2-2-50 formula, others 4-4-50, and yet others 4-6-50 or 6-6-50. The more common strength is probably 5-5-50. It can be varied to suit. That strength, however, will not injure vegetable growth. Watch well your mixing.

Copper Sulphate	5 lbs.
Fresh Lime	5 lbs.
Water to make	50 gal.

Dissolve the copper in hot water or by suspending in coarse bag near top of a vessel of cold water. Slake the lime separately and strain. Do not add water in too great quantity, but allow to perfectly slake before diluting and straining.

Dilute the strained lime to about 25 gallons, likewise the dissolved copper solution. Then, simultaneously pour the two solutions together into the barrel from which the sparying is to be done.

Don't pour one into the other and don't mix strong solutions.

Copper Sulphate Solution.

Strength a.

Copper sulphate (blue vitrol)	1 lb.
Water	15-25 gals.

Dissolve the copper sulphate in water when ready for use. This strength is to be used only before the buds break. It should never be applied to foliage. For peaches and Japan plums use 25 gallons of water.

Strength b,

Copper Sulphate (blue vitrol)	1 lb.
Water	200-300 gals.

This solution is gaining ground as a substitute for the ammoniacal carbonate of copper in spraying ripening fruits, especially plums. At the rate of 1-4 pound per barrel it is equally effective and seldom injures the foliage appreciably, though it is always better to add a little milk of lime. Use the weaker strength given on peaches and Japan plums. It does not stick like Bordeaux, and must be used about twice as often.

Ammoniacal Copper Carbonate.

Copper carbonate	5 oz.
Ammonia (26 per cent Beaume about	3 pints.
Water	45-50 gals.

Make a paste of the copper carbonate with a little water and dilute the ammonia with 7 to 8 volumes of water. Add the diluted ammonia to the paste, but be careful to use only enough to dissolve all the copper carbonate. Allow the solution to settle and use only the clear blue liquid This loses strength on standing in open vessels, but may be kept indefinitely in a stopped bottle indefi- spraying dilute to 45 to 50 gallons.

Iron Sulphate and sulphuric Acid Solution.

Iron Sulphate (copperas)	110 lbs.
Hot water	26 lbs.
Sulphuric acid	1 qt.

Add the acid to the copperas and pour on the water. Use when fresh. To be used only as a wash before the buds swell, applied with brush or sponge. Its chief value is for grape anthracnose.

Potassium Sulphide Solution.

Potassium sulphide	1-2 to 1 oz.
Water	1 gal

This loses strength in standing and should be used immediately. Keep the sulphide in a stopper bottle. Valuable for mildews, especially the gooseberry mildew.

DUST "SPRAYS."

The dust sprays have not as a rule been favorably received in California, but there are occasions when they work satisfactorily. The dry Bordeaux is as follows:

Materials required to make seventy pounds of a stock powder:

Four pounds of copper sulphate (blue stone;) four pounds of good quick lime; two and a half gallons of water, which is to be added to the quick lime; sixty pounds of air-slaked lime, which has been sifted through the fine sieve mentioned below.

Directions: 1. Break up into small lumps about seventy or eighty pounds of quick-lime and spread it out so that it will become air-slaked. When slaked and perfectly dry sift it through the fine sieve (100 meshes.)

2. Completely dissolve four pounds of copper sulphate in two and a half gallons of water. The easiest way is to suspend the sulphate in a coarse bag just below the surface of the water until it is dissolved.

3. Pour gradually two and a half gallons of water over four pounds of good quick-lime in such a manner as to slake it to the finest powder and give a good milk of lime solution; let it cool.

4. Put sixty pounds of the sifted, air-slaked lime into a shallow box—one in which the material can be well worked with a hoe or shovel.

5. Pour the well stirred milk of lime and the copper sulphate solution at the same time into the third vessel containing the lime and stir it until the whole is thoroughly mixed. It will have a deep blue color and be thick. This is so finely divided that it will remain in suspension for hours.

COMBINATION OF INSECTICIDE AND FUNGICIDE.

The only safe combination of this character, is that of Bordeaux mixture and Paris green or London purple. The combination of these mixtures results in no injury to the foliage of the plant treated, and yet each retains its value to the extent of being as good when used separately. The great value of the combination is in lessening the cost of the treatment, for we save the cost of one application. In preparing the mixture use the formula for Bordeaux mixture and add to it the Paris green or London purple at the rate of 1 pound to each 200 gallons of the mixture. While using keep the mixture well stirred.

Avoid Doubt Buy Studebaker Buggies

Never any doubt about the lasting qualities of a Studebaker carriage or buggy. It's the material that goes into them—plus the way they are made—that makes Studebaker vehicles of such high quality, perfectly proportioned and easy running. The "know how" which can only be derived from long experience goes into every Studebaker buggy—fifty years of expert skill and planning.

In Studebaker Buggies

you'll find the best vehicles money can buy, because the choicest materials such as are obtainable only through the facilities of the world's largest vehicle factory make the Studebaker superiority.

If you appreciate Quality and Satisfaction, **ask the Studebaker agent** to show you the new 1908 Studebaker buggy. Over a smillion Studebaker vehicles now in use. If you mention this paper and send us two cents in postage, we will mail you "Studebaker" 1908 Farmer's Almanac—FREE.

THE WHITTIER FARMERS' INSTITUTE

The agriculturists of Southern California will have an opportunity on the 17th, 18th, 19th and 20th of this month to gain much vauable instruction from the course of lectures to be delivered by scientific men at Whittier, the occasion being a special Farmers' Institute, celebrating the opening of the Southern California Pathological Laboratory. Lectures will embrace vegetable culture in its varied forms; walnut growing, covering its diseases and remedies; citrus growing, through its diversified conditions of soil, cultivation, fertilization, irrigation, handling and transportation.

The Pathological Laboratory, its relation to the grower and the benefits to be derived from it, will also be discussed. Some of the strongest men in the State are assigned special topics and the occasion is to be made one of the most important in the history of institute work in this part of the State. By all means do not miss this school of instruction. There will be none better in Southern California this year.

In connection with this meeting there will also be held an exhibit of citrus fruits and other products related to the subjects under discussion. In conjunction with the California Fruit Growers' Exchange and others, a large display is in preparation, of sample boxes of citrus fruit representing the various brands shipped from the State. A particularly fine exhibit of lemons is expected from the members of the "Lemon Men's Club," representing all the important lemon shipping houses of the State.

Mr. Ralph Smith writes that Mr. G. Harold Powell will prepare a display, representing some of the most striking results of his important investigations, while the work of the Pathological Laboratory will be represented by various exhibits.

Exhibits of any articles of interest to fruit growers are invited for this display and should be sent, prepaid, to the Pathological Laboratory, Whittier, California, to arrive not later than Monday, March 16, or may be brought to the exhibition hall.

Tuesday will be vegetable growers' day. Topics treated will be: "Vegetable Industry;" "Cabbage Growing;" "Tomato Growing;" "Celery Growing;" "Plant Lice;" "Benefits of Agricultural Experiment Stations;" "Relation of State to Farmer."

Wednesday will be walnut growers' day. "Walnut Industry;" "Walnuts in France;" "Planting the orchard;" "Blight Control;" "Pathological Laboratory;" "Conservation of Fertility;" "College of Agriculture" will be topics.

Thursday will be laboratory day. There will be inspection and dedication with banquet in the evening. Governor Gillett, President Wheeler, Prof. Wickson, Commissioner Jeffery and others expected.

Friday is citrus growers' day. "Citrus Culture in Sacramento Valley;" "Citrus in Tulare County;" "Fruit Shipper and the Laboratory;" "Handling Fruit" and other instructive topics.

Amongst other speakers are Prof. Wickson, Dr. M. Osmun, Lambert, Hazeltine Woodworth, Steadman, Cogswell, Neff, Dunlap, Roeding, Ramsey, Chapman, Mills, Smith, Jeffrey, Reed, Powell, Teague and True.

It will be an intellectual feast for soil tillers. They should take a week off and attend.

DISEASE GERMS AND THE FARMER.

We have been much interested in the lectures of Prof. Herbert Conn, on Bacteriology, which ran through a series in the Country Gentleman, of late One discourse especially appealed to our mind as worthy of more than passing reading. This address referred particularly to "Disease Germs and the Farmer."

Those of us who have had practical experience on the farm with barb wire, and rusty tools, know how common it is to receive ugly wounds which often cause prolonged annoyance and sometimes result seriously. A hurt produced by a jab from a rusty fork tine will often lay the victim up for days. He is fortunate if he does not have blood poisoning, as rusty iron or steel points are often coated with microbes of a poisonous nature, which, when brought into contact with the blood corpuscles, germinate into death producing bacteria.

Prof. Conn treats these germs as affecting the body in three different directions, first, as they directly pertain to wounds and the treatment of them, we quote what he says:

Of the various human diseases known to be caused by bacteria, we have no space to mention more than one or two. One of the most common of the diseases produced by the growth of these parasites is blood poisoning, and this is a matter of so much practical importance that it is desirable to refer here to a few prominent facts. Blood poisoning is a term that has a variety of meanings, and refers to a series of infections differing greatly in severity. On the one hand are severe cases of blood poisoning, called septicaemia or pyaemia, which spread rapidly through the body and result in death; at the other extreme are such very slight troubles as are characterized by the appearance of slight inflammation resulting in boils or festers on the skin, which soon come to a head and discharge a little pus, and heal rapidly. Between these extremes we have forms of various severity—abscesses, carbuncles, felons and various grades of severe blood poisoning affecting the whole body. It may seem at first strange to class together the extreme cases as rapidly fatal blood poisoning and such slight, unimportant phenomena as little abscesses and inflamed spots in our skin; but study has shown that they are all produced fundamentally by the same type of bacteria, and differ from each other chiefly in degree of intensity, rather than in kind.

Every farmer is liable to more or less injury to his hands, or elsewhere, breaking the skin, and thus allowing a possible entrance for these germs into the sensitive parts beneath. It is therefore a matter of great practical importance that all should learn how to treat such wounds to prevent the danger of such troubles as far is possible. The method of treating wounds is simple and at the present time even an uneducated person is in a better position to treat wounds properly, so as to prevent blood poisoning, than our best physicians were a generation or more ago. The two precautions that should be taken are:

1. The wound should be cleaned as thoroughly as possible of all dirt that may have entered. To do this, it should be washed, preferably wi water that has been boiled and subsequent cooled, for such water will be practically steri Thorough washing and cleaning is always first necessity of treating any wound.

2. The application of some disinfectant to t wound is always desirable. For this purpose many of the ointments for sale by druggists are excellently adapted; for most of these consist of an oily substance to protect the wound from the air, and contain a quantity of some disinfectant to protect the wound from any germs that may be on the surface. An excellent wash for this pu pose is a 5 per cent. solution of carbolic acid, made by adding one part of carbolic acid to twenty parts of water. If the farmer will keep on hand such a carbolic solution and acquire the habit of cleaning and then treating every bruise and wound with this solution, afterwards covering it with a clean cloth, he will avoid a large proportion of the inflamed sores and sometimes the serious troubles that may follow the wounds and bruises that he is liable to receive. Hardly anything will be more likely to reduce unpleasant results which follow wounds than this simple procedure:

It should be also noted that sometimes germ of even more serious nature enter wounds that extend deep into the flesh. The germ of lockjaw lives in the soil, and when one receives a de p wound from any object that has been lying on the soil, these germs are liable to get into the body. If they do so, and grow, fatal results are almost certain. The only precaution the farmer can adopt in this matter is to remember that deep wounds made by objects lying in the soil are exceptionally dangerous, and in case such a wound is received, a physician should be e ployed at once

The rush to buy lands in California is in no sense abated. Railroad agents report the capacity of their lines taxed to the limit to accomod e the thousands who are fleeing from the East t this State in quest of agricultural holdings. Dur ing the past sixty days, it is estimated more lan in California have been sold to actual settlers th in any similar period for years. These purchas are not all "tenderfeet," seeking the balmy atm phere which this State furnishes, but habitant our own cities, who, wearied by the nervous t sion co-existant with city business life are g to the country to find a home where excite does not make them grow old before their time

We quite agree with Prof. Wickson that the periment station movement is likely to be ov done. The proposition by a Kansas congressm to establish 100 experimental farms of one each in every county in a group of four Wes agricultural States, is about the limit of surdity. It would be far better to increase the propriations for those already organized and m them bigger and better every way, than to large the number and limit their usefulness want of support.

THE ECONOMIC AND AESTHETIC VALUE OF THE HOME GARDEN.

Continued from First Page.

to think of them: Fried chicken, roast pig, wild and tame turkeys, ducks and geese; venison just killed; squirrels, rabbits, pheasants, partridges prairie chickens; biscuits, hot butter cakes, hot buckwheat cakes, hot wheat bread, hot rolls, hot corn pone; fresh corn boiled on the ear, succo tash, butter beans, string beans, tomatoes, pea Irish potatoes, sweet potatoes; buttermilk, swee milk, "clabber;" watermelons, cantaloupes al fresh from the garden apple pie, peach pie, pumpkin pie, apple dumplings, peach cobbler I can't remember the rest."

Central California

Dinuba is soon to have a new station on the Santa Fe.

The prune market seems to be decidedly dull at the present moment.

Rainfall at Tulare to date amounts to 9.19 inches as against 7.66 last year.

Olive growing has proved very successful in the Turlock section this year.

One farmer at Hollister has been investing in a bunch of fine Shire mares.

The California Wine Association is setting out a large number of vines near Gilroy.

The Central California Produce Company at Turlock is lining up for a good season.

Parajo Valley claims this will be its banner year in the amount of apples produced.

Many Santa Clara Valley orchardists are giving heavy winter irrigations to their orchards.

The Central California Bee Keepers' Association recently held an interesting all-day session at Hanford.

Turlock fruit growers are appealing for a rabbit drive to rid that section of some of their unwelcome guests.

The output of the Parajo Valley last year of apples aggregated 2058, and the total gross value was $1,423,528.

Soledad says that its crop prospects at the present moment are decidedly lighter than at the same date last year.

San Bernardino orchardists are spraying with sulphur, lime and salt wash to kill winter aphis from the trees.

Tulare Grange recently devoted one session to discussion of what variety of peaches were desirable for this section.

County Entomologist Morris of San Jose is directing a large number of spraying operations in the Santa Clara Valley.

The Orchard City Grange at Campbell recently held a pleasant meeting with third and fourth degree work followed by a banquet.

The fruit inspector of San Benito county reports some sections slightly affected with peach blight, but nothing of a serious nature.

Hanford is raising money to compensate its committee man for his recent visit to Washington in the interest of the sulphur ruling campaign.

Tomato planters near Turlock are putting in extensive hot beds for planting seed for tomato plants. One grower there will plant 20 acres this year.

Managers of the Visalia sugar factory are preparing for an early campaign in sugar making this season. It is hoped that by the 1st of June at the latest.

The contractor who recently created so much disturbance by his destruction of trees in the Big Basin Reserve urges investigation that he may prove that he did not destroy valuable trees.

The cutting of giant redwoods in the Big Basin which created such a stir, especially at San Jose and points near the reserve, that the order permitting the destruction of the monarchs has been rescinded.

Southern California

Oxnard has a ginseng farm.

Oxnard has 14 inches of rainfall.

Alfalfa hay harvest began last week in Imperial valley.

San Bernardino is planning for races on March 17th.

Coachella valley is also experimenting with sugar beets.

Orange and lemon land in and around El Cajon is in great demand.

Fullerton has a pullet which is claimed to have laid 172 eggs in 7 months.

A quarter of a million of tomato plants are now being transplanted near Brawley.

Three thousand blight resistant scions have been set in the orchards of J. B. Neff of Anaheim.

San Diego merchants are now shipping quantities of mountain apples to Los Angeles.

Spraying machines at Riverside are in constant demand and every one available is in use.

E. C. Bryan of Spring valley is now plowing under a very rank growth of fully matured peas.

A Lemon Cove orchardist planted Canadian field peas extensively the past season for soiling crops.

Coachella valley is making hay from Bermuda grass, which is said to be fairly good feed for the stock.

Wm. H. Fisher of El Cajon has four old Mission olive trees that produced two tons of olives the past season.

The quality of oranges in Southern California is remaining exceptionally fine, puffs showing up in very few orchards.

Geo. M. Hawley is now marketing from his La Mesa ranch strawberries that run eight berries to the box. Next!

Covina farmers held an interesting farmers' club meeting last week. The next meeting will be held on March 21st.

While the Salton Sea at the present moment is receding but slightly, the total fall during the past year has been three feet.

The Santa Ana Valley Walnut Association now has 207 members who delivered to the association last year 1,060,000 pounds.

Riverside orange groves are showing a slightly reduced output over that which was expected at the beginning of the season.

The purple scale parasite, recently introduced from China, is declared to be doing some good work near Fullerton and Anaheim.

Orange county has organized the Orange Protective Association. Any farmer may become a member by paying the 25 cents per acre fee.

The hand picking over of lima beans in Ventura packing houses has just been finished. Many of these beans were spoiled by being out in the October storm, necessitating the expensive sorting.

Southern California cattle owners are experimenting with a new cattle dip which is taking the place of the old oil dip. The effective agent in the dip is said to be arsenic, and is recommended by the Bureau of Animal Industry.

The Coast

Peach trees are in full bloom in Lewiston, Idaho.

All sheep coming into Colorado are now compelled to be dipped.

Fruit trees at Walla Walla, Wash., have begun to bud and blossom.

A new grange was recently organized at Ellensburg, Washington.

A county farmers' union has been organized at Bridgeport, Washington.

Farmers at Greeley, Colo., still have 2300 carloads of potatoes yet to market.

An interesting farmers' institute was recently held in Waverly, Washington.

Heavy rains at Lewiston, Idaho, have been of great value to crops in that section.

Fruit men at Billings, Montana, will entertain the next State horticultural meeting.

Neary 1,000,000 fruit trees have been planted in the vicinity of North Yakima Valley this season.

The Department of Agriculture is experimenting in the planting of tobacco in the Hawaiian Islands.

The Chewelah, Washington, creamery paid the farmers in its immediate section $16,000 for cream last year.

North Yakima hop growers are destroying their hop yards and the ground will be used for fruit planting.

The Clearwater Fruit Growers' Association at Grangeville, Idaho, has reorganized for another year's work.

Fruit growing is continually increasing in Northern Idaho, although alfalfa is as yet the principal product.

Water was recently turned into the Leesburg canal, Rio Grande, New Mexico, which irrigates 200,000 acres of land.

A lecture train on the farmers' institute plan will be run on the O. R. & N. railway starting from Pullman this week.

Montezuma Valley, Colorado, will soon open 75,000 acres to settlement. This is under a recently completed irrigation project.

The price of butter at Seattle, Washington, is much lower this season than ever before at this date. Its present quotation is 25 cents.

Sheep men of Washington have sent a delegate to Washington to plead for more favorable ruling in the forest bureau rules as to pasturage.

Fort Collins, Colorado, has a new irrigation scheme which involves the expenditure of $800,000, and which will irrigate over 300,000 acres.

Eugene, Oregon, has a civic betterment league which is creating a sentiment toward planting of shade and ornamental trees along the streets.

President Roosevelt has created another addition to the Grand Canyon Reserve by adding 1,288,320 acres of land to the Tonto National Forest.

Sheep men of Arizona who gather their flocks near Phoenix for the shearing season are reported to leave in that city over $100,000 each year.

The Utah State Bee Keepers Association is endeavoring to re-establish the bee industry where it was destroyed by the smelter smoke nuisance, since this nuisance has been abated.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

HATCHING WITH HENS.

"The best time to set a hen is when a hen wants to set."

THERE is now, and perhaps always will be, those who use hens for hatching their chicks, rather than the incubator. Without entering into any discussion as to the merits and advantages of atificial and natural methods of incubation, we will give a few rules to observe when using hens for hatching chicks.

Where to Set a Hen.

The quarters for the setting hen should be as comfortable as possible, and as convenient for those that look after the wants of the hens during the period of incubation. Remember the old saying "Whatever is worth doing is worth doing well." So, give the hens a chance.

Kill off the Lice.

We mean by this don't set your hen and leave her to be worried for three long weeks with lice and expect to get a good hatch. Have a nice clean nest, either whitewashed or sprayed with kerosene emulsion, then put in nice clean straw. If your house is a light one your nests should be darkened some, but not too dark. Your hens should have a run for exercise, for unless they have exercise they are apt to sit too close and a poor hatch is the result.

Keep Her Away from the Others.

If possible remove the setters from the laying hens, for if they have access to the same nests there will be broken eggs. So as far as possible, avoid all chance for trouble.

By all means keep the nests clean, as absolute cleanliness in the nests is a condition for good hatching. If a nest be fouled or an egg broken, it should be cleaned, the eggs washed in lukewarm water, the nest material removed and new nests made as soon as possible. It is a good plan when making a nest to sprinkle it well with a good insect powder, then give the hen a good dusting when the eggs are put under her. Again, about the middle of the hatch, then a good dusting a few days before the hatch and in this way you will not be troubled with lice.

Care of Setting Hens.

If you find it necessary to confine the hens to the nests, and you will unless you are absolutely certain they will not leave them, they should have an opportunity to leave the nest within 24 hours after being set. In case they do not come off of their own accord take them off, for unless you do they are almost sure to foul the nest.

If your hens are inclined to be wild and easily excited, let them off just before night, they will eat and take exercise and be ready to go back just as it begins to get dark and will return often of their own accord. After you have let them off at this time for several days and they are beginning to get used to their new quarters, let them off a little earlier so they may have plenty of time for food, and to take a good dust bath.

Food for Sitting Hens.

Sitting hens should be fed only on whole grain. We never give our hens a mash. Neither do we feed much green food. Whole corn is best food for them. We never feed fir or Egyptian corn, as it kee bowels too loose. Provide ple fresh water and grit. Treat kindly and you will have no t and be very careful not to them when hatching, as then th more excitable, and if they b scared at this period they d make as good mothers.

STATE FAIR PREMIUMS.

The writer has been favored a proof sheet containing the pre list of the poultry department f coming State Fair which will b at Sacramento the first week September.

The directors certainly have very liberal in placing such a amount for poultry, and ough bring out a large entry. We this is a larger sum than is giv any State Fair association for try.

Sweepstake Prizes.

There is also a special of $15. best display in any single v comprising not less than 25 mens. For best display by one bitor in American, Asiatic, Me ranean and English classes; $ for first and $5.00 for second, $5 for best display of ban games and ducks.

Last year the association bui new poultry house, which is one the best ventilated and lighted pou try houses on the coast; this, w the generous cash premiums amo ing to over $3500.00 ought to br out one of the largest entry made in California. The premiu for all recognized standard variet will be $2.50 for first, $1.50 for ond and 50 cents for third. T will be given on cock, cockere and pullet, with $4.00 for first, $ second and $1.00 for third on br ing pen, consisting of one male four females.

The entry fee for single bird be 50 cents each for first ten 25 cents for each additional bir $1.25 for each breeding pen. will include coops, feed and during the fair; all birds w cared for by the superintende returned at close of fair.

Now, Mr. Fancier, the asso is doing its part and it is up to bring out your birds and this show one of which the will be pround.

AROUND THE YARDS.

It is not best to keep eggs than two weeks before incu and the fresher the better.

* * *

Eggs intended for inc should be kept in a dry place temperature of about 40 to grees.

* * *

Only well formed, smooth eggs should be set, for rough gular shells are not so strong, they are set the breakage wi greater.

* * *

Eggs that have been shipped be allowed to stand for 24 hour ter being received. This will the contents of eggs to regain normal condition.

* * *

Never put more eggs under a

Trim the Comb.

Will trimming a pet game cock's comb disqualify him for exhibition purposes?—"O. L."

All game and game bantam cocks except Cornish Indian should be dubbed before being exhibited. Care should be taken to do a nice, smooth job, as neatness is considered by the judge.

* * *

What is the Matter?

Kindly tell me through your paper what may be the matter with my chickens. They are Plymouth Rocks and die one by one from a disease which begins with the chicks going lame on one leg. Within two or three weeks this gets worse and the chicken lies down and dies. Almost to the last day the affected chickens have the best of appetite and bright red comb and look as healthy as possible, except that they cannot walk. I cut open several of them and found a peculiar white growth inside under the backbone. Ever since I had these chickens, which is two years, I noticed that they at times seem to be weak in the legs. Some of them seem to get over it, however; I lost several dozen from the disease. It does not affect roosters, only hens. The flock has a run over five acres of land and gets all the green food they may want, besides green food and meat and plenty of fresh water and gravel. Last year I got new roosters for the whole flock, but it seems that this did no good, because it is worse this year than ever.—R. S., Redwood City.

We are unable to tell what ails your birds; the fact that they have such good appetites till last would indicate intestinal worms, but worms would not cause them to go lame. Did you ever open intestines and look for worms?

Can any of our readers give us any light on the subject. We have shown this letter to several poultrymen, but they were unable to tell what was the matter.

* * *

Incubation.

I have a hot air machine (1906 Cyphers.) Do you think they need extra moisture as Mr. Ironmonger advises for duck eggs in Cultivator, Feb. 21, 1908? I find I have the best hatches from turkey hens if they are set on the damp ground, but I do not know enough about incubating to give the eggs more moisture on my own judgment. Is it necessary to keep the large end of the egg up in the incubator?—Subscriber.

Turkey eggs are treated same as hen's eggs in incubators; [illegible] they are easier to hatch than hen's eggs. It is not necessary to keep eggs on small end during incubation. Incline them same as hen's eggs.

FOLKS IN RUTS.

Th' world is full of ruts, my boy,
some shaller and some deep;
An' ev'ry rut is full o' folks, as high
as they can heap.
Each one that's grovelin' in th'
ditch is growlin' at his fate,
An' wishin' he had got his chance
before it was too late.

They lay it all on some one else, or
say 'twas just their luck;
They never onct consider that 'twas
caused by lack of pluck.
But here's th' word of one that's
lived clean through, from soup t'
nuts;
Th' Lord don't send no derricks
'round t'h'ist folks out o' ruts.

Feed the Chicks and Kill the Gophers

West Coast Chick Feed

A full, rightly balanced ration for the little ones, to be fed dry. All pure feed, no filler, no waste. The biggest seller because the best made. Keeps them growing and healthy. For sale by many dealers; if not by yours send direct to us.

Bille's Gopher Poison

is most attractive to gophers, squirrels, etc., but sure death. Endorsed by Agricultural Colleges and Experiment Stations. Has had the greatest success for years in the Middle West, and also here in California last season. Circular with many testimonials and Affidavit of 201 killed in one day. If your dealer hasn't it, send $2.50 for two bottles, (not less than two) express prepaid by us. Money refunded if not as represented—so printed on the bottle.

Starbuck's Barred Plymouth Rocks
We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are laying fine. We have divided into pens according to the way they are showing up in six months laying. $2.50 for 13 eggs from first pen. $1.00 from 2nd. until they have time to make longer records. (Except from our one best. not for sale. We claim the world's Barred Rock, 6 months laying record for this one.) Do you wish to hear about our prize winning Buff Orpingtons and Silver Wyandottes? We have something to crow about. No Sunday sales or visitors. ***Wm Starbuck & Son. Fullerton***

WATERMELONS FOR PROFIT.

The watermelon as a food for man dates back to the remotest times. Egyptian inscriptions of it is as of high antiquity. It is said to be a native of tropical Africa, from which locality its culture gradually spread to Asia Minor, India and the Mediterranean.

Soil for Watermelons.

Best soil conditions generally described is a rich, sandy loam. There is, however, many varieties of this soil, the best is what is termed decomposed granite, such as compose most of the California mesa lands. The soil formed of decomposed sandstone is the poorest, as in that case there will be a lack of phosphorus and potash, both of which are highly essential to the growth of a good watermelon. Where the soil is too rich in nitrogen, the melons will have thick rind, the flesh will be coarse and stringy, besides lacking in flavor and sweetness. Heavy soils are very likely to be productive of mildew destructive to the leaves and vines.

Time of Planting.

As watermelons are of tropical origin, the atmospheric and soil warmth must correspond closely to the conditions prevailing at the tropics and subtropics, otherwise the seed, if planted, will rot if not sprouted before planting. Even if sprouted, the plant will chill and die if too cold, if the soil temperature does not reach 70 deg. at least once in 24 hours, the plant cannot live and thrive.

The earliest successful planting in California is about the 15th of March, and that early only in the most favored sections, and then with favorable weather. Shallow planting should be the rule. With early planting cover with about one inch of damp soil, press it gently, and afterward with the hoe throw over the pressed surface a half inch of loose earth, and this will prevent it drying out.

Varieties to Plant.

For many years the Georgia rattlesnake watermelon was the favorite of the Pacific Coast. Next came Kalb's Gem; it met with some success, but soon dropped out of the race. The Sweetheart and the Cuban Queen came and shared the fate of the above, as did Kleckly Sweet and a host of others. Rattlesnake still held the field when the Chilian burst into the melon world, and in one short season proved its supremacy. This was eight years ago. But every living thing is the natural parent to its successor, so out of the Chilian evolved the Angeleno, a melon that promises to claim the field as its own inside of the next few months. For shipping, plant the Angeleno, Chilian, Rattlesnake and Kolb's Gem are favored in the order named.

For the home garden, plant Angeleno Chilean Klecksley Sweet Phillipino and the Sweetheart in the order named. For an early good melon plant Flordia Favorite. Do not plant earlier than here advised or the chances are ten to one that the plants will be destroyed by the aphide.

Do not forget to bluestone your seed. To omit this is to invite disaster.

Mode of Sprouting Melon Seeds.

Dig a square hole about eighteen inches deep, make a small fire in it. When it is well started add small pieces of wood until the hole is nearly full, as soon as it ceases to smoke cover the red coals over by putting a barrel head over it. Do this in the morning, at the same time put the melon seed to soak in warm water. Place in a warm spot. In the evening pour a bucketful of warm water into the hole. Feel with the hand that it is not too hot. If it is pour in a
cold water as is needed. Wh
soil feels blood warm, put yo
in bags—stocking leggings w
and place in the hole. Pour in
warm water to cover the bag
put in a suitable piece of boa
piece of tin over the bags, fill

Veterinary

Dr. R. T. Whittlesey, veterinarian, of 714 East Seventh street, Los Angeles, will answer questions in this department. In writing of sickness or injury to any animal be explicit in giving symptoms and particulars. Always enclose full name and address, but if assumed name or initials are prefered they will be used.

If an immediate mail reply is wished enclose $1.00 for such service, but for replies in paper, only, no charge is made if the answer will be of general interest.

Abortion in Cows.

Please inform me through the Cultivator what is the cause of cows being affected with abortion as it is getting to be a serious drawback in this locality. In many cases there are one-third and in some cases fully one-half calves six weeks or two months previous.—R. R., Grizley Bluff.

It may be contagious or non-contagious, but if there is a series of cases it must be looked upon as the former, in which case it is due to germs which may be heged and carried in the genitals of either the male or female.

The most thorough disinfection ot these organs as well as the stables and yards must be carried out.

The subject is a most extensive one and if you will write the Bureau of Animal Industry, Washington, D. C., asking for special bulletins on "Conagious Abortion in Cows," you will receive free literature covering the subject exhaustively.

Barrenness.

I would like to know if there is anything I can do for a cow that does not come in heat. Cow is in good condition. Been milking 12 months.—J. S. R., Gilroy.

Try an impregnator, they are usually successful. If you decide you want to try one we can send it from an instrument house here, cost will be $3 or $4, but will last forever.

Heaves.

What causes heaves in horses? Is there an absolutely harmless remedy or treatment that will relieve the attacks? I have a good work horse that would be a very valuable animal were it not for that affliction. Perhaps for three or four weeks he will seem almost free from the trouble and can stand work as well as any horse, then suddenly a violent attack will seize him. What kind of feeds will be best for him?—J. R. S., Bloomington.

The most frequent cause is the feeding of musty hay.

The relief must come principally through dieting. Feed the cleanest and best of hay and in not very large quantities; that is, the diet must be concentrated, more grain and less hay. Put two or three tablespoons of air-slaced lime in the horse trough every day, sprinkle the hay with the same. Don't water for an hour after feeding. Keep the bowels rather loose; green feed in small quantities when possible.

REVERSES.

Lady—But you should begin at the bottom and work up to succeed.

Tramp—Yep; but I never got a right start; even de trade I learned went just opposite.

Lady—What was your trade?

Tramp—I was a well digger.—Exchange.

WINSEL'S ANNUAL.

Chas. Winsel, one of the up-to-date seedsman of Los Angeles, is out with his "Annual Garden Calendar" which is his record winner. It is 72 pages and cover and full of good things for the garden, as the egg is full of meat.

The best part is the planting calendar, which fits California conditions to a dot.

Only One "BROMO QUININE"

Dimes Or Dollars

A hen does well or poorly according as her food supplies necessary nutriment in right proportions. Doubtless you give a nutritious ration, but does the *larger part of it digest?* If not, your profits will be in dimes rather than dollars.

It is easy to see why this is so. The domestic hen is a captive; she is denied the privilege of selecting food at times and in ways that Nature meant she should. Man attempts to coax and cajole her into laying many eggs under these unnatural conditions, and it is evident there can be little success until natural conditions are restored as far as possible.

If you make the hen derive from her food the same elements she would get when at liberty, your end is gained. This can be *largely* brought about by giving once a day a small portion of

DR. HESS
Poultry PAN-A-CE-A

It is the prescription of Dr. Hess (M.D., D.V.S.) and according to the testimony of expert medical men, contains the elements necessary to make the hen *digest perfectly* by far the greater portion of her food, and to *derive from it* increased power to produce bone, flesh, feathers and eggs. Poultry Pan-a-ce-a contains also iron for the blood and nitrates to expel poisonous matter. It makes young chicks grow fast and fits fowls for market in the shortest time. It is also a germicide and prevents roup and other poultry diseases. Endorsed by poultrymen in United States and Canada. Costs a penny a day for 30 hens.

Sold on a written guarantee.

West Coast Cresol Dip

Strongest and most effective Germ Destroyer, Insecticide and disinfectant. Made of Coal Tar Creosote Oil. Great caution must be exercised in using Carbolic Dips and those that contain Petroleum oils. Reports in 1905 from Wyoming show that many sheep died on account of dipping in petroleum. Sulphur-Lime dips impair the quality of wool on sheep, and sometimes blind them. Tobacco dips very often sicken sheep. And none of these dips can compare in effectiveness with Cresol Dips. These, while being most effective, are perfectly harmless. Wool is improved by their use, as it not only cleanses the wool but leaves no stain and gives it a soft texture.

But Cresol Dips differ very much. A Coal Tar Dip depends for its activity almost entirely upon the Cresylic Acid it contains. West Coast Dip is guaranteed to be made from Coal Tar Creosote Oil containing 25 per cent Cresylic Acid. Most dips sold in the United States are made from domestic creosote oils, which run about one-half the strength of imported oil. Permission was given by the U. S. Dept. of Agriculture to use our Dip for the treatment of sheep scab in the proportion of one part Dip to 67 parts water. This is the highest dilution we have ever heard of being permitted by the Department. When thus diluted it costs but a trifle.

For sale by many dealers. If yours does not keep it, send direct to us for trial offer, "special price and freight prepaid."

MILK FEVER.

SEVERAL of the questions now waiting for replies are in reference to milk fever. The explanation of this disease is too long for the brief spaces afforded in the query column.

Milk fever has proven easy to prevent and easy to control. We no longer need dread its coming. The causes that produced milk fever are definitely known and prove to be readily controlable. If milk fever develops through carelessness the cure is simple, easily applied and inexpensive. Treatment must be prompt, however, before congestion has become deep seated to affect a cure. Milk fever is a disease confined largely to heavy milking strains of dairy cattle, cases are hardly known among range cattle.

The Range Cow.

The cow under nature's care has little to fear from milk fever. She drops her calf out in the field, then lies down quietly to rest until hunger drives her out to graze. Carefully and most thoroughly she hides away the tiny calf, yet never staying away long from it, if she is left undisturbed by the intrusion of rude men. These cows never overload their stomachs with heavy food, and the calf has its frequent little meals during the day time. The range cow has not a great flow of milk to distress her and the calf's small meals relieve any distention. There is no great or continuous pressure of milk on the mammary glands. The little milk the calf takes keeps things in balance for the cow. This is the natural cow under nature's kindly sway.

Dairy Cow.

The dairy cow is forced to a heavy milk flow by long years of heavy feeding and by the selection of the heaviest milking dams as mothers for the sires of the herd. This is an unnatural condition of affairs, and the civilization of the cow makes her nervous and fretful. When she calves she is, or should be, promptly secluded and as soon as possible left alone. The average dairyman will give the cow a mash of bran or of some patent cow drink, then hold the little calf up to nurse. This all starts the milk flow with a rush. When the udder fills, the milker tries to be "kind" and starts in by milking the cow out dry. The udder collapses on itsedf and a chill follows. The milker, when he has drawn the milk to the last drop, goes away whistling to his other duties thinking he has relieved the cow when he has reallly left her with a fighting chance for her life. The cow may survive, and in five cases out of six does, from this barbarous treatment. The sick cow is struck down with milk fever. Like a thief in the night comes this dread disease. In its suddenness it is appalling.

The Disease.

How does it act? Well! The cow that was seeming well in an hour will be found to be down and unable to rise. When forcibly stood up she sinks down again, she has lost all power in her hind quarters. Fever with delirium follow and the poor creature throws her head violently from side to side as she moans and groans. Later comes complete quiet or coma and death follows in twenty-four to forty-eight hours. Heifers never milk fever; it is a disease of th ture well-developed cows. For when a cow recovered from o tack the advice was always giv turn her off for beef. She w sidered to be a certain vict milk fever at her next calving

Cures.

The Germans have studied into this disease and finally f cure. They said it was ba contamination of the milk ce vesicles of the udder. Certain Schmidts did cure many se cases of the disease. The trea consisted of injecting the udder a sterilized solution of iodide of tassium. This was supposed to stroy the bacteria forming in th der and to destroy them. One a "vet" was called to a herd had three cows down with fever. The first two he injecte iodide of potassium making the tion, giving her the powder. becoming great, he told the d man's wife to prepare the third tion, giving her the powder. Th cow was duly injected and the day all were doing well. The er's wife handed him the pap powder saying, this is the p you left behind yesterday. He knew the third cow had res as promptly to simple water a others had to the iodide. The ca soon talked about and other doc related similar results.

Trials Proved.

The various experiment stat took up the work and found that medicine had no effect. Air then used and this was found to fully as effective as water. T causes of the disease was found careful study to be the result chill following a collapsed of the udder. The shock of followed by the removal of a fluid contents of the udder pr a condition, not easily explained disordered blood flow accompa with spinal congestion and lo motion. In some cases appo comes on to relieve the sufferer. Law, of Cornell, visited the d men of the Island of Jersey; told him they did not know the ease. He watched their meth handling a herd and found never milked out the newly cow until forty-eight hours calving. He asked, why? Was they had always been taught it not good to do so.

HOW TO DOCK.

The best time to dock lambs do it at the right time wheth employs the chisel and mallet, h et and mallet, knife or hot pi for instruments. Any of the struments will give good resul influence growth of the lam little if employed before the la over 10 days or two weeks of However, if the lamb gets four or weeks of age, docking may b sorted to, but danger from bl to death or interruption of grow may be expected.

To dock, one man should hold the lamb by its hind legs, back downward, and with its tail laid acro block he should draw the loose skin about the root of the tail toward the body of the lamb, while another cuts the tail off with a chisel and malle or hatchet and mallet. If a knife or

hot pincers are employed the block is not necessary. The stub should be about one and one-half or two inches long. So soon as the tail is removed the skin should be let loose, which then slips back and partially covers the stub.

The lambs as they are docked should all be turned into a pen by themselves where they can be looked over every 20 minutes or so for a couple of hours, so as to give aid should any need it, to prevent their bleeding to death. Should any bleed hard after ten minutes the stub may be ligated with a piece of twine, or a red hot iron may be used to sear the wounds. Where lambs are permitted to go undocked until quite large, the twine ligature should be put on what is to be the stub before the tail is cut off. Then after the blood has clotted for two or three hours the string may safely be removed with a knife.

A NOTED HORSE.

The famous show stallion Kentucky Peak 6335, choked to death a short time ago at the form of his owners, J. R. Peak & Son, Winchester, Ill. Kentucky Peak was foaled in 1885, and was sired by Idol Wilkes, sire of J. H. L., 2:08¼, the sire of Ardelle, 2:04¼, dam Lady Rothschilds, by Rothschilds; second dam Black Rose, by Ericson 130. He was a horse with a great deal of speed, but no effort was ever made to develop, but in the show ring he could brush as fast as the record horses and was almost invincible as a ribbon winner. He won first premium at the World's Fair in Chicago in 1893, over a great field of the best show horses, but his greatest show ring achievement was at the World's Fair at St. Louis in 1904. He was then 19 years old, and he won the light harness stallion prize over the greatest array of show horses then on the tan bark. His winnings in the show ring total almost $12,000, a figure attained by a very small number of show horses. While no effert was ever made to train his get he is the sire of three standard performers. Few horses ever made more for their owners than did Kentucky Peak. The $12,000 to his credit was won simply as an exhibition stallion and not as a race horse, and only goes to show that there is money in good horses, and that it is not necessary to put them on the track, even though they be bred race horses.

A CONTEST OF CHAMPIONS.

The International Live Stock Exposition is the clearing-house of all the live stock shows of the continent. If a prize winner at other shows be of sufficient merit to have the slightest prospect of winning an International premium, it is sure to be there. The International show is, therefore, a contest of champions, and the ribbons won are held in the highest esteem. The students' contests originated by President J. A. Spoor of the Union Stock Yards, and enlarged upon by the generosity of Mr. J. Ogden Armour, are alone sufficient to place the Chicago International at the head and front of live stock educational institutions. The fat hog, sheep and cattle exhibits surpass anything else of the kind on the face of the earth. The Chicago International is the one show which no self-respecting stockman can afford to miss. The International show of 1907 opens on November 30th and continues to December 7th. Note the sales of pure bred cattle and sheep advertised in this paper.

TEN YEARS AHEAD
OF ALL OTHER
CREAM
SEPARATORS

In skimming efficiency, simplicity, durability and convenience, the new 1908 improved De Laval Cream Separators are fully ten years ahead of any other machine on the market today. Thirty years of experience, protecting patents, and the many valuable improvements devised and perfected by the De Laval engineers in all parts of the world during the past three years, are responsible for this fact. Every feature of the De Laval has been improved, from the supply can to the base. The new centre-balanced bowl with its separate spindle is alone a triumph in separator construction and must be seen to be fully appreciated. Then, there is the new one-piece "anti-splash" sanitary supply can, adjustable shelves for skim milk and cream receptacles, new frame designs, and many other but less important improvements,—all combining to make the De Laval as nearly ideal as a separator for farm and dairy use can be made. There is the proper size machine for every size dairy from the smallest to the largest and no cow owner can afford to be without one of these improved machines. It will cost you nothing to see and examine the new De Laval and right at your own home too, if you will but say the word. Our new illustrated catalogue describing the De Laval improvements in detail is sent for the asking. Write us at once and you will receive this interesting book by first mail with full information as to how you may have a free demonstration of the improved De Laval in your own home.

Light and Cook with Colt Acetylene

Here we have a sketch showing a Colt Acetylene light plant in operation. You will note that it is a very simple outfit that can be installed in any house without trouble. The small machine simply sets in one corner of the cellar or shed on a low platform, and is connected with chandeliers in every room, by small pipes running inside the walls, out of sight. That's all there is to it—just the machine, the fixtures and the pipes. Over 150,000 country homes, churches, hotels and stores are lighted by such plants. You can obtain full information concerning Colt Acetylene plants and installations, fixtures, stoves, etc., by addressing

Roselle or Jelly Plant

For some eight or ten years the culture of Roselle has been engaged in in California by certain gardeners, but its merits are understood by few. It is yet too early to plant, but none too early to call attention to this admirable addition to the garden. The writer has grown it for seven or eight years and not until last year was there any failure. At fruiting time last fall the continued warm rain caused mildew and a loss of part of crop and all of seed.

This year, Bordeaux will be used if moist weather comes at fruiting time.

Regarding this plant a Department Bulletin says:

A strictly tropical plant, the roselle is very sensitive to frosts. This, together with its peculiar habit of blooming late in October regardless of the time when the seed is planted, has restricted the cultivation of the roselle to tropical and subtropical regions. Its distribution, for this reason, has not been so general nor has the plant become so widely known as introduced plants indigenous to the Temperate Zone. It is, however, only rational to assume that this objectionable feature could be overcome were persistent efforts made with that end in view and that the roselle, like so many other cultivated plants which have yielded to changed climatic conditions, would adapt itself to the shorter summers of a higher latitude.

Introduced several years ago into California and Florida, the roselle deserves a wider cultivation than it now enjoys and should prove a valuable acquisition to the tropical islands of the United States and to the Canal Zone. The cultivation of the roselle is so simple and its requirements so few that in the Tropics and Subtropics it should be an indispensable plant in the garden of every family. This fact, in view of its peculiar adaptability for jelly making, should cause the roselle to become a plant of considerable importance in the United States at no distant date. The roselle is probably the only plant in cultivation in which the part utilized for food is the calyx. Of rather low nutritive value, the thic
calyx possesses excellent qualti
the manufacture of jelly and
products. Preparations made fr
closely resemble in color and
those made from the cranb
is rather singular that its se
maturity also coincides with
the cranberry.

In Queensland, where the
of the roselle has in recent y
sumed considerable proportio
fruit is utilized largely in the
facture of jam. In the United
its principal use would probably
a substitute for cranberries in
household and in the manufact
jelly.

The habit of the roselle is
to that of the cotton plant;
is reddish, branching profusel
usually planted—that is, in Fe
and March—the roselle at
height of from 5 to 7 feet. The

POULTRY

BLACK MINORCAS OF QUALITY—A Choice lot of large size cockerels bred to standard requirements. A rare chance to get an excellent breeder $2 to $5. One pen mated up for my own use of finest high scoring female specimens and layers, standard weight and over, to a grand cock bird which headed Geo. H. Northup's first pen last season. A few settings to spare at $3.00. J. P. McDONOUGH, Geyserville, Cal.

WHITE WYANDOTTES—"CREAM OF THE Coast" strain—the 200-per-year kind. Barred Plymouth Rocks, my "Blue Diamond" strain, are great winter layers of big, brown eggs. No incubator lots furnished. Eggs per 13, after Jan. 1, carefully packed, $1.50. Address WILLIAM C. PARKER, 111 Pacific avenue, Santa Cruz, Cal.

GERMFOE KILLS THE GERMS—GREATest disinfectant known. Sprayed about it prevents disease—a few drops better than a pound of cure. Large bottles 50c, or smaller bottle by mail prepaid same price, if your dealer hasn't it. Diluted with 50 to 100 parts water, a little goes a long way and costs but a trifle. WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

EGG-MORE, THE GREATEST OF ALL "egg-makers" and the biggest seller. Highly concentrated though not a strong tonic and stimulant. A little daily with the feed does the business. A 25-lb. $2.00 pail for $1.50, if you haven't tried it; freight prepaid by us, if you name this paper. WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

FISHEL'S WHITE WYANDOTTES—GOING out of business. Will sell 12 pullets, 6 and 10 months old, mated with high grade cock, $23.00. Five hens mated with strong, vigorous cockerel, $9.00. Also a few cockerels $2.00 and $3.00, or in lot to suit. Eggs from above stock $1.00 and $1.25 per 12. Address B. KOBELT, Petaluma, Cal.

BUFF ORPINGTON DUCKS, THE GREAT commercial bird; good for market; great layers. Eggs now $3.00 per 12; $5.00 per 26 from our imported English blue ribbon strain. GOODACRE BROS., Compton, Cal.

DAYTON'S ROUP TABLETS ARE GUARanteed to cure or money back—not talk back—money. 50c by mail if your dealer hasn't . WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

KILLAMITE KILLS THEM—BEST INSECT powder made for fowls or plants. 50c for 2½ lb. sifting can, express prepaid by us if your dealer hasn't it. WEST COAST MILL. 818 San Fernando St., Los Angeles, Cal.

COLUMBIAN WYANDOTTES — NEVER fail to win in the hottest competition. A few trios for sale. Eggs $3 and $5 per 15. F. J. IRONMONGER, 127 N. Garfield Place, Hollywood, Cal.

WHITE PLYMOUTH ROCK SILVER CUP winners at the big Chutes Park show, January 6th to 12th, 1908. Eggs, $2.50 and $2.00 per 13. Average score of first pen 95½. ADAM RANKIN, 271 Isabel St., Los Angeles, Cal.

WEST COAST CHICK FEED MAY COST A little more, but you can't afford to feed the little ones anything but the best. Of dealers, or $3.50 cwt., f. o. b. Los Angeles. WEST-COAST MILL, 818 San Fernando St., Los Angeles, Cal.

FOR SALE—LINE BRED WHITE ROCK cockerels from Mrs. Basley's original strain. Write for prices. Also eggs for sitting $2.50 per 15. MRS. KATE B. JOHNS, Compton, Cal.

FOR SALE—S. C. RHODE ISLAND RED hens and pullets and Black Minorca hens. Eggs for hatching from pen of Hoganized R. I. Reds, $1.50 per 15. MRS. L. M. RUCKER, R. F. D. No. 1, Chico, Butte Co., Cal.

INDIAN RUNNER DUCKS AND BLACK Langshan fowls. Eggs and stock for sale. Large, fine stock, with good range and strong fertility. CLYDE J. MOSS, Corona, Cal.

BERRY PLANTS.

PROTEST OF THE PINES.

List to the pine trees' plaint, we pray, ye thoughtless men of the town;
What boots your lesson of Arbor Day when at Christmas ye cut us down?

We stand, close arrayed, in the pure, crisp air, on the mountain's rock strewn side.
And yet ye would strip all the slopes so fair, and lay us low in our pride.
The young and the straight ye would slay and slay, to deck in a tinsel gown—
What boots your lesson of Arbor Day when at Christmas ye cut us down?

In our wind-swept home we wax strong and tall, as we nod through the summer days;
A-swing in our branches the wild birds call, and the squirrel in our deep shade plays;
And yet your dread ax at our roots you'd lay, and the hills leave bare and brown—
What boots your lesson of Arbor Day when at Christmas ye cut us down?

The winter snows but serve to show our clothing a deeper green;
No blast that the king of storms can blow, bites us with its frost-fangs keen;
The wolf and the deer pause on their way, and rest 'neath each swaying crown—
What boots your lesson of Arbor Day when at Christmas ye cut us down?

So leave us untouched on our hillside home—drag us not into Yuletide joys—
For what can a pine tree, torn from its loam, mean unto your girls and boys!
Rather teach them to worship us here, we say, where the Hill Gods smile and frown—
What boots your lesson of Arbor Day when at Christmas ye cut us down?

List to the pines trees' plaint, we pray, ye thoughtless men of the town;
What boots your lesson of Arbor Day when at Christmas ye cut us down? —Denver Republican.

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL

For the Human Body —It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons Exterior Cancers, Boils Corns and Bunions CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

Not Connected With Other Stores

Intelligent Buyers Appreciate Our Methods

Stores using the sensational special reduction and great discount methods are often considered low priced, while stores transacting business on a straight price system are assumed by many to be high priced. A little careful consideration will show you the error of this assumption and convince you of the advisability of buying under our system of pricing and selling, furniture, carpets and draperies.

Our Store Is the Low Priced Store

We have but the one price for all and that price is as low as it is possible to sell good qualities. If furniture is originally priced right there can be no special reductions or discounts. Stores employing such methods must price their goods high to provide for the great reductions. Such stores must then be high priced and you are paying much more than the goods are really worth. Our every day, plain figure prices are the right prices and are lower than you will find such goods priced elsewhere. We have the largest and finest stock on the Coast.

THE GARDEN.

Plant a little pleasantness in the path of life;
Plant a little happy-heart in the fields of strife;
Plant a little smile-of-face on the windy heather—
Pleasantness and happy-heart, smile-of-face, together!

Plant a little kindly-deed in the toiling garden,
On the little window box, with its dolly-varden;
Plant a little helping-hand, till above the shadows
All its bloom of beauty smiles, June-sweet in the meadows!

Plant the seed of cheerfulness up and down the street,
Cast on every barren life that you chance to meet
Helping-hand and kindly-deed, cheerfulness—till yonder,
All the world be glorified with the bloomy wonder!

—Baltimore Sun.

ENJOY THE GARDEN.

THE love of dirt is among the earliest of passions, as it is the latest. Mud pies gratify one of our first and best instincts. So long as we are dirty, we are pure. Fondness for the ground comes back to a man after he has run the round of pleasure and business, eaten dirt, and sown wild-oats, drifted about the world, and taken the wind of all its moods. The love of digging in the ground (or of looking on while he pays another to dig) is as sure to come back to him as he is sure, at last, to go under the ground and stay there. To own a bit of ground, to scratch it with a hoe, to plant seeds, and watch their renewal of life,—this is the commonest delight of the race, the most satisfactory thing a man can do.

Let us celebrate the soil. Most men toil that they may own a piece of it; they measure their success in life by their ability to buy it. It is alike the passion of the parvenu and the pride of the aristocrat. Broad acres are a patent of nobility; and no man but feels more of a man in the world if he have a bit of ground that he can call his own. However small it is on the surface, it is four thousands miles deep; and that is a very handsome property. And there is a great pleasure in working in the soil, apart from the ownership of it. The man who has planted a garden feels that he has done something for the good of the world. He belongs to the producers. It is a pleasure to eat of the fruit of one's toil, if it be nothing more than a head of lettuce or an ear of corn. One cultivates a lawn even with great satisfaction; for there is nothing more beautiful than grass and turf in our latitude. The tropics may have their delights; but they have not turf; and the world without turf is a dreary desert. The original Garden of Eden could not have had such turf as one sees in England. The Teutonic races all love turf; they emigrate in the line of its growth.

To dig in the mellow soil—to dig moderately, for all pleasure should be taken sparingly—is a great thing. One gets strength out of the ground as often as one really touches it with a hoe. Antaeus (this is a classical article) was no doubt an agriculturist; and such a prize-fighter as Hercules coudn't do anything with him till he got him to lay down his spade, and quit the soil. It is not simply beets and potatoes and corn
and string beans that one rais
his well hoed garden; it is the

Peas With Butter.

one quart of shelled peas in a
n and add enough boiling wa-
cover them generously. Place
ot fire and when they begin
to boil draw back where the water will bubble gently. Until the peas are done cook with the cover partially off the stewpan. When the peas are tender add one teaspoonful of salt and three tablespoonfuls of good butter. Cook ten minutes longer. If the peas are not the sweet kind add a teaspoonful of sugar with the salt and butter.

HOMELY HINTS.

Care of Brooms.

Brooms will last longer and give better satisfaction if they are taken care of.

They should be dipped in boiling suds once a week and then plunged into cold water to stiffen the straw. It stands to reason that a dust gathering implement should be thoroughly cleansed once a week.

Another good thing to do to a broom is to clip the ends of the straws when they become worn down. They will gather the dust better in this way.

Linoleum and Oilcloth.

Linoleum is made with a mixture of powdered cork, linseed oil, resin and a pigment pressed on burlap between heated rollers. The patterns are printed on it and it is then varnished.

Oilcloth is made by applying several layers of coarse paint to burlap or coarse canvas, finishing with finer paint, then painting on the pattern and finally varnishing. It can easily be seen that these cloths, finished as they are with varnish and paint, should not be washed with strong soaps or alkalis, and that a careful oiling now and then will surely be beneficial.

Oilcloths may be kept bright for years if properlly varnished each season.

They should never be scrubbed with a brush, but after being first swept should be cleansed with a large, soft cloth and cold or lukewarm water, in which has been dissolved a little borax, dip a flannel cloth in milk and with this wipe the oilcloth. Linoleum may be brightened with a little glue water.

Melt a little ordinary glue in water, apply with a flannel cloth. The linoleum should be clean and dry before rubbing it with the glue water.

Space in a crowded closet can be saved by using the patent hangers made for men's trousers, the little metal strip holding a dress skirt smoothlly across the front breadth.

Keep a bottle of linseed oil and lime water, together with a roll of absorbent cotton and pieces and strips of old linen for bandages, all in a convenient place to use in case of burns.

For burns.—For burns apply spirits of turpentine. It is easy to apply, and gives instant relief.

Remedy for scalded mouth.—In cases of scalding the mouth with hot liquid, gargle with a solution of borax.

A certain cure for ringworm.—Rub the ringworm three times a day with vinegar in which salt has been dissolved.

Turpentine for cuts.—For a severe cut or bruise apply cold turpentine; it will give certain relief almost instantly.

Care of the frying pan.—Always wipe your frying pan out with brown paper directlly after using and before washing, if you want to keep it nice and bright. An omelet pan should never be washed, but rubbed clean with brown paper

A stained sink.—Pour oxalic acid on spots, let stand a few moments, and the stains will disappear.

LAUNDRY NOTES.

Javelle Water for the Removal of Stains.

One of the best chemical reagents to be used in the laundry, and for cleaning purposes generally, is javelle water. It can be very easily made at home, if the following directions are carefully followed, and is not in the least expensive.

How Made.

Dissolve one pound of washing soda in an agate kettle or stone jar, in a quart of boiling water. Dissolve one-half pound of chlorid of lime in two quarts of cold water. When the dissolved portion has settled, carefully pour the clear liquid into the dissolved soda. Bottle and keep in a cool, dark place.

Kinds of Stains.

Stains which bother in the laundry are of three kinds, i.e., those caused by vegetable growth, those from actual chemical compounds, and those caused by deposit of small, solid particles.

Mildew is, perhaps, the stain which puzzles the housekeepere the most. It is the most common type caused by vegetable growth. When this stain is examined under the microscope, one can see a network of tiny tendrils which cannot be seen without the aid of the microscope. On the ends of some of these tendrils can be seen small cup-shaped organs, which hold small seeds or spores, which scatter over the cloth and start new plants. This is the way the mildew stains spread all through a garment. These little tendrils will, if given time, find their way through many layers of the material.

Oxygen will destroy the mildew plant, but it will thrive in a damp, warm place. To remove mildew from a garment, first give it a thorough airing and then place in boiling water. After it has been placed in boiling water, the character of the stain is changed and it is now a chemical compound, for the mold has produced a dye. A bleaching process has to be resorted to now to remove the stain. Soak the garment in equal quantities of hot water and javelle water until the stain disappears; thoroughly rinse in three waters; then rinse in water to which a little ammonia has been added.

In most all processes of bleaching an acid is formed which will weaken the fibers of the cloth and, if very strong, will destroy them, unless quickly neutralized by an alkali. Ammonia or washing soda solution are the best to use for this purpose. —Lotta I. Crawford, Assistant, Department of Domestic Science, Colorado Agricultural College, Fort Collins.

WHY HE WENT BELOW.

"I am sorry to say that you will have to step downstairs," said the guardian at the narrow gate.

"Why—why—" the poor soul stammeringly pleaded, "did you look at my Sunday record?"

"I did," was the response.

"Wasn't it all right?"

"Fine! You went to church practically every Sunday, I observe."

"Well, what's the matter, then?"

"Unfortunately I looked at the record of your other days, too, and it is a rule up here that no man can squeeze enough righteousness into one day to offest working hard at the other line of business during six days. There is some talk of revising it so that such people will be permitted to spend one day in heaven and the other six in the cellar, but until that is done, if it ever is, you will have to step below."

So the poor soul stepped.

Hay.

Somers and Co. say:

There has been a little increase in hay shipments during the week, the total showing 3320 tons in comparison with 2990 tons for last week. In spite of these rather heavy arrivals the market has maintained its previous range so no change in the matter of prices can be reported. There is a somewhat better feeling amongst the various merchants who although they can as yet report no increase in the volume of trade, yet most of them seem to anticipate an early improvement. This hope alone if it becomes general will result in improved conditions and as the hay business is particularily sensitive to general trade conditions, we may resonably anticipate a better condition of affairs here in the near future.

It is rather gratifying to learn that stocks are being rapidly reduced throughout the country, for in spite of the recent depression most of the principal hay centers report rather free shipments to many points throughout the interior. This is good evidence that the State is steadily growing and that many districts that a short time ago produced hay have now become consumers for this particular product. The aggregate demand from these interior towns has been considerable and has assisted materially in relieving the San Francisco market of what might otherwise have proved a most burdensome oversupply of hay.

Crop conditions are still most promising, and as grain values are very well maintained, it is expected at the moment that the grain crop will be a most excellent one and the hay crop one of good quality and probably not too abundant.

Choice wheat hay	15.00@16.50

ADDING AN ADAGE.

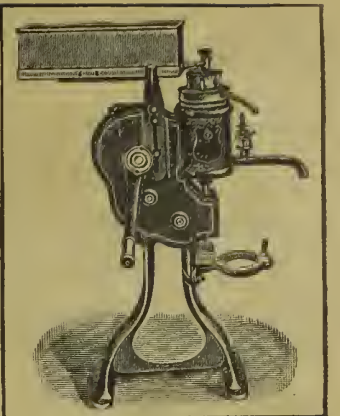
A lady told this story about a little girl who had been taught to pray:

"Lord, make me a good little girl," she said one night; and here, forgetting the rest of her prayer, she added what her teacher had taught her at school that day:

"If at first you don't succeed, try, try again!"—Home Magazine.

The sub-surface "packer," the implement for dry farming operations, illustrated and spoken of in the dry farming article of this issue, is a new tool on the Coast. One of them is soon expected in Los Angeles and will be on exhibition at the seed store of Johnson & Musser, North Main St. It is an essential in dry farming operations and said to do its work perfectly.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.



FOR 16 YEARS THE BEST!
STILL BETTER IN 1908
UNITED STATES
Cream Separators.

The United States has always, since its introduction, separated more cream from the milk, and has done it more thoroughly and quickly than any other separator. The figures of the public national and international tests demonstrate this.

THE 1908 MODELS HAVE IMPROVEMENTS

which make the handling of milk still easier, quicker and more profitable. They do their work more efficiently, more economically than any other, and are built to wear. In spite of the fact that the demand is greater than ever before, and that dairymen everywhere are exchanging other makes for the reliable and efficient United States, the standard separator, we are prepared to make prompt deliveries anywhere.

Do you want to make money? Here is your chance. Get a set or two of our pipe tools, make up a stock of pipe and do contracting of installing irrigating systems. Your neighbors are wanting something to save water and labor. Here it is. Write for our Brown Book. It contains much information for those interested in irrigation.
KELLAR & THOMASON
COVINA, CALIFORNIA

Back of the Ban

Book

Is the "Tubular" Cream Separator

EVERY dollar of the farmers' and dairymen's money in the banks of this country represents hard labor and wise economy. It represents head work as well as hand work. But it is a fact that the farmers and dairymen whose balances in the bank are the biggest are not always the men who work the hardest with their hands—nor even the ones who farm the most acres or milk the most cows. They are mostly the men who make every movement count by employing the latest appliances and the most economical methods in their work. They are the men who make mind master over muscle. Much of their wealth is therefore the result of economy—the saving of what others waste. This means that they are always figuring on how to increase profits without increasing expenses. The first question with such men, when considering the purchase of a new machine is, not how much will it cost, but, **what will it do?** Will it save anything which now goes to waste? Will it do this profitably? That's the test we ask you to apply to the **"Tubular."**

Saved Price in One Season.

CHERRYVALE, KAN.,
June 13, 1907.

I can sell my butter to customers where I never could sell it before getting the separator. We milk six cows and it will make more than enough butter extra to pay for the machine in this one season.

LAURA I. TURNER

Twice as Much Cream.

PINE BLUFFS, WYO.,
May 14, 1907.

We get twice as much cream as we did skimming by hand. Tubulars soon pay for themselves.

MRS. G. W. RUSSELL.

Twice as Much Butter.

KAW, OKLAHOMA,
April 24, 1907.

Make about twice as much butter from seven cows, and of a better quality than we did without it.

MRS. MARELLA.

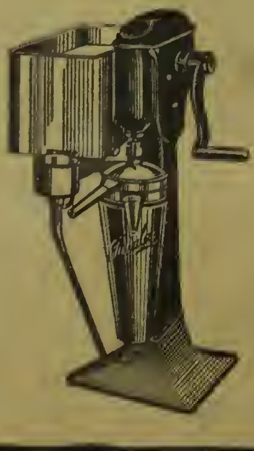
Saved Cost in Six Months.

ALTAMONT, MO.,
April 24, 1907.

We have a Sharples Tubular Separator No. 4, which we have run three seasons, and which paid for itself in the first six months it was run.

ROSS DeFORD.

The Best by Every Test



We ask you to apply this test because it will be to your interest to do so. If the **"Tubular"** will increase your profits without increasing your expenses you ought to have it. It will. It will make every cow you milk earn more money. That's why we want to put a **"Tubular"** back of your bank book. Thousands of farmers and dairymen testify to the merits of our machines. They say the **"Tubular"** pays for itself in a short time. When it has paid for itself all that it saves is clear profit for there's no expense—it won't cost you a dollar a year for repairs. We've built it so that it can't.

If you are economically inclined; if you want to save money and increase your bank account here's your chance. Our valuable book, **"Business Dairying"** will show you how, and our latest catalog tells all about the **"Tubular."** We'll send them both **free** if you will write today, ask for book No. 260.

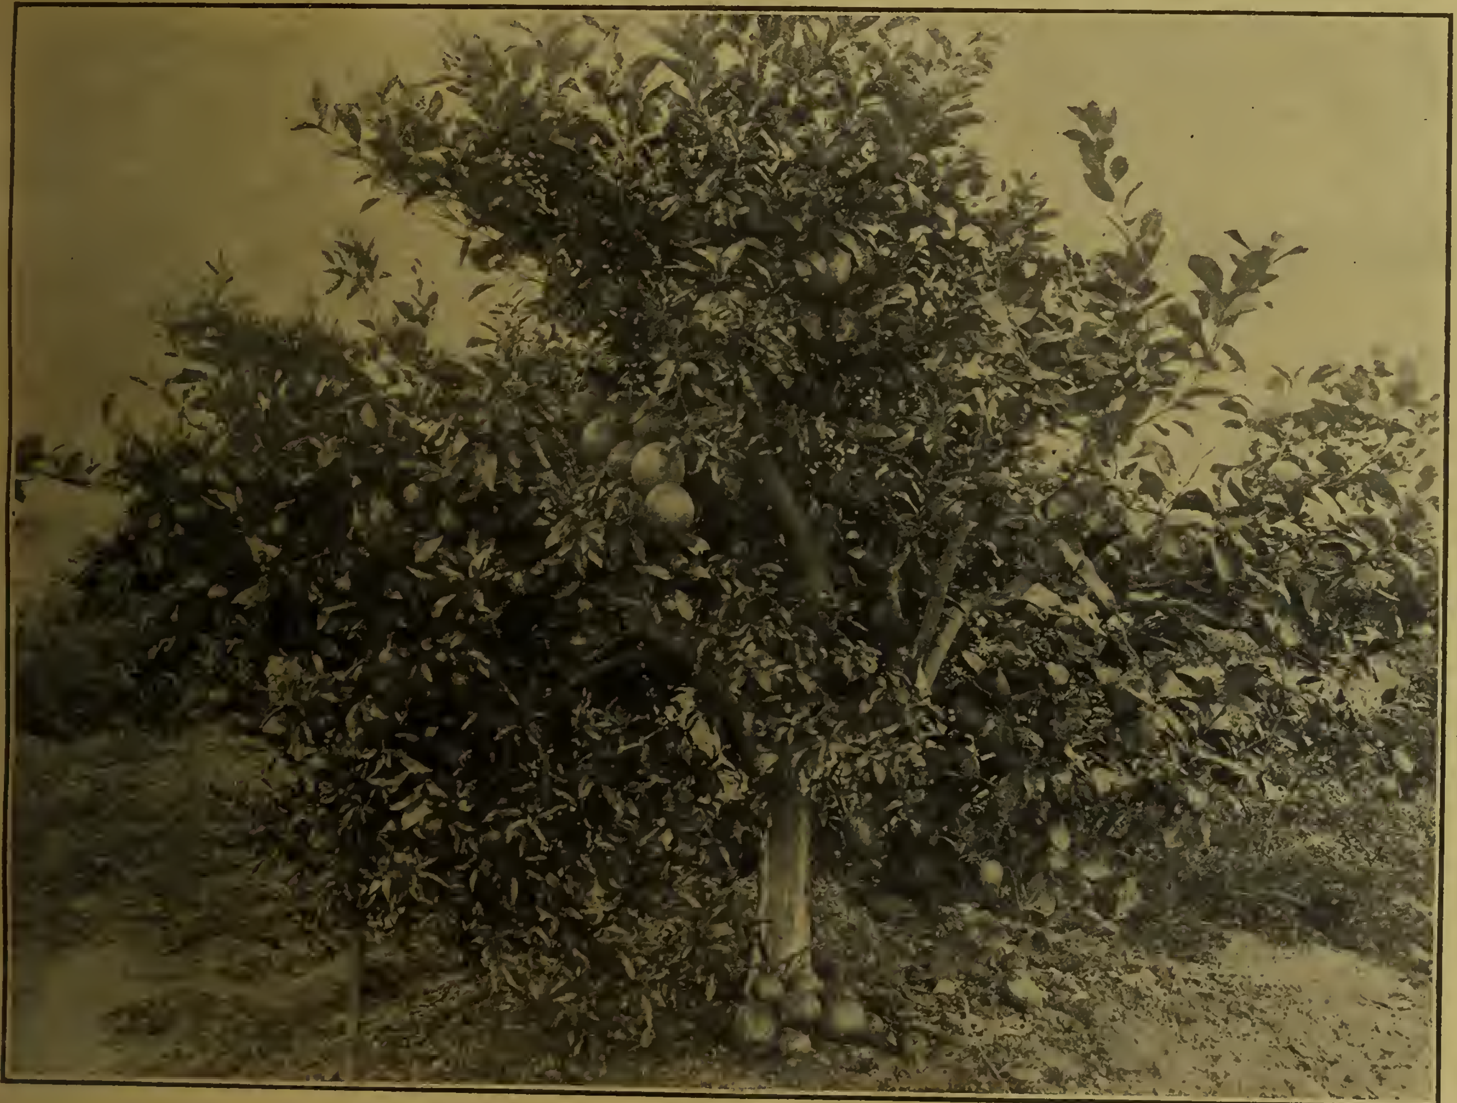
An Object of Interest

A Citrus Tree Budded to 22 Different Varieties, Embracing Navels, Valencias, Seedlings, Tangerines, Pomelos, Lemons, Etc.



Courtesy San Dimas Nurseries.

REE like the above may be interesting and a novelty, but
t a commercial factor, of course. But it may cail atten-
n to the fact that as an interesing object and as an orna-
the yard, the orange is pre-eminent. All over the State
ge is exhibited in front yards as proof of the matchless cli-
ar to the North of San Francisco in Sonoma county is
le, noted for its citrus fair. No one ever heard of Clover-
ges in great quantity in the Eastern markets, but as an ad-
he has used the orange judiciously and effectively, and to-
itrus fair is known over the State.
rserymen plan for this home-ground ornamentation by growing exceptionally large and fine trees. For city and suburban home grounds these specially grown and budded trees posses an economic and ornamental value which entitles them to first consideration. No evergreen tree possesses a grace and beauty beyond that of our well-known orange and lemon trees. When to this is added the fruit product of citrus trees, it is obvious that no home garden or orchard can be considered complete without a representation.

So, plant an orange tree. If your principal product is from the vine or deciduous tree or the cereals, still plant the orange and when your Eastern friends cross the desert to visit, you can give of the luscious fruits of the tropics to refresh.

Not Connected With Other Stores

Intelligent Buyers Appreciate Our Methods

Stores using the sensational special reduction and great discount methods are often considered low priced, while stores transacting business on a straight price system are assumed by many to be high priced. A little careful consideration will show you the error of this assumption and convince you of the advisability of buying under our system of pricing and selling, furniture, carpets and draperies.

Our Store Is the Low Priced Store

We have but the one price for all and that price is as low as it is possible to sell good qualities. If furniture is originally priced right there can be no special reductions or discounts. Stores employing such methods must price their goods high to provide for the great reductions. Such stores must then be high priced and you are paying much more than the goods are really worth. Our every day, plain figure prices are the right prices and are lower than you will find such goods priced elsewhere. We have the largest and finest stock on the Coast.

ternational Institute of Agriculture

An Institution Proposed by an American, Adopted by Europe and Now by America, Which May be a Factor in More Intelligent Marketing of Our Crops

International Institute of Agriculture at
e is a unique institution. It is in a
by itself. It is not for instruction, as
quiries would imply, but strictly for in-
on, the collection of data, and the
dissemination of information of interest
ations of the earth. It is to deal especi-
the economics of agricultural produc-
distribution, and with the sociological
of agriculture. Its novel character
ie plans for its development a matter of
interest.

fer the conception of an international
of agriculture belongs to an American,
d Lubin, of California, who sought the
e of the King of Italy in carrying the
effect. The plan appealed to the King,
ed a call, through the Italian ambassa-
he different nations of the world for a
e at Rome to consider the advisability
ishing such an interantional institute.
erence took place in May, 1905, one
and fourteen delegates representing for-
ries being present. After deliberating
g over a week on the matter, the
l" was adopted and signed by the dele-
sent, providing for the establishment
stitute and outlining its constitution
tions. The convention was afterwards
by plenipotentiaries of the respective
. Twenty-five nations, including near-
agricultural importance, have joined in
rtaking and pledged their support.

untry has made an appropriation of
the payment of its quota toward the
f the institute for the fiscal year 1907,
for the salary of a member of the per-
ommittee and for the expenses of dele-
the general assembly of the institute.
in Government is erecting a palace in
ns of the Villa Borghese in Rome to
eadquarters of the institute. This is a
two-story building, containing an
hall and executive and clerical offices.
ment has been made that the first
of the permanent committee in charge
titute will be held this spring, and the
will be inaugurated and enter upon ac-
as soon thereafter as possible.

meantime the Italian Royal Commission
ated an inquiry into the exact character
t of the information which the differ-
ries are in position to supply with re-
heir agricultural production. This in-
will be catalogued and classified, and a
n it will be ready for the use of the
committee when it meets. The sys-
peration in various countries for the
of agricultural statistics are also be-
d, in order that the value of these sta-
y be judged of and means of improve-
gested where desirable.

nctions of the institute are strictly
and sociological. While its duties
been worked out in detail, the "acte
scribes as among the principal duties
nstitute shall collect, study and pub-
omptly as possible statistical, tech-
economic information of interest to
sts, excluding "all questions relating
to the economic interests, the legislation and administration of any particular nation." More specifically the data sought for publication relate to the cultivation of the soil, crop production, trade in and prices of agricultural products on the various markets, wages of rural labor, the appearance, spread and means of control of new diseases of plants. It will also give special attention to the subjects of agricultural co-operation, insurance and credit. It is designed, therefore, to serve as a great intelligence bureau of the countries interested, for the dissemination of information relating to agricultural production throughout the world, and many economic and social phases of agriculture.

Harvesting Scene in Colusa County.

The finances of the institute are co-operatively provided. The calculated annual expense of the institute is about $175,000. Toward this sum the King of Italy has given the revenues of two domains near Pisa, which amount annually to $60,000. The balance of $115,000 is to be raised among the nations on the basis of units of subscription, which also determine the national representation and voice in the management of the institute. Five groups are recognized. Group 1 carries five votes and sixteen units of subscription, group 2 four votes and eight units, group 3 three votes and four units, group 4 two votes and two units, and group 5 one vote and one unit of subscription. For the first two years a unit of subscription is placed at $300 per annum, and the constitution provides that it can never be more than $500. The subscriptions, therefore, range from $300 to $4800 per annum. Each nation elects the group it will join in the management and support of the enterprise. The United States has come in on the basis of group 1.

The control of the organization is placed in the hands of a general assembly of delegates, sent by the adhering nations and presided over by an elected president and two vice-presidents. The permanent committee, composed of members designated by the respective governments, is intrusted with the executive management of the institute, under the direction and control of the general assembly. Members of the committee may serve as the representative of one or more nations, but the actual number of members is to be not less than fifteen. The general secretary will act both for the committee and the assembly.

Thus there is brought into existence a real parliament of the nations, with a permanent cabinet and ministry devoted soley to a consideration of agricultural interests. It is a significant step in international co-operation, and the more so because it is directed toward the greatest of international industries and the one most far-reaching in its sociological influences. It signifies a uniting of forces in peaceful and productive occupations in mutual aid for mutual benefit. As such it is noteworthy as marking another step in the progress of civilization.

Brief mention was made last week of the appointment of a referee board by President Roosevelt to take up and determine, so far as practicable, the question of fruit sulphuring. This being an acute subject, the fruit growers of California desired to be represented on the board by one of the best informed authorities the State possesses. Dr. Taylor, of the University of California was selected, and his appointment meets with very general favor, we judge. The sulphur question is an all important one to California fruit raisers, and for a time it looked as if it were going to be decided adversely to their interests. However, the indications are for a conservative ruling, the Secretary of Agriculture having stated that nothing shall be done to injure the interests of growers until the whole matter is thoroughly gone into and determined on its merits.

HANDLING FRUIT.

THE following criticism by a packer, as published in a Washington paper, will apply with much force here as well as elsewhere:

"There is no question as to the fruit which can be and is grown here, but it certainly can be said that the proportion of men who know what to do with it after it is grown is limited. I know nothing about the growing of fruit, and don't profess to, but I do know how to handle it, and starting in at the beginning I say that right here I notice a tendency to allow the fruit to remain too long on the trees. I visited one large ranch and told the proprietor that his fruit should be taken sooner. He said that if he allowed it to remain it swelled. Well, a couple of days later I saw that a shipment of two cars of peaches had demoralized the Seattle market. I knew where those peaches were from. They were in such condition that they could neither be held over nor re-shipped. The bottom went out of the market. In other words, the man who wants to let his fruit swell, and, therefore, his receipts also, may miss it.

Packing and Handling.

"Another criticism is the failure to learn how to pack and handle the fruit. Kindergarten methods are bad. And right here I want to say that more fruit is spoiled through loose packing than through solid packing. Slack packing will chafe the life out of the best fruit grown. The keeping qualities of green fruit are such as to enable the buyer to regulate his business. There seems to be an impression that Seattle is the whole coast; that is with those shipping west. If they would remember that there is a long coast north and south some of the fruit wouldn't swell as much.

"The tendency to try to realize on the whole orchard is to be deplored. Windfalls and good fruit all come together in so many instances as to indicate that something is wrong. Fruit in poor company is known by the company it keeps. Graded fruit will bring a better return than the run of the orchard unselected. Growers can ship less and get more money. Not only that, but they can turn their attention to utilizing the by-products and add to their revenue.

"That there are not more individual shippers is a surprise. The fruit men throughout the country with a national reputation are not men who grow better fruit than that produced here. There is none better. They are the men who select their own shipping stock and keep out the inferior stuff. Here you have scores of men with the necessary capital to enable them to do their own business, and I am surpised that so few are thus engaged. Those making the greatest success have taken that step. The money goes with the greatest care and attention.

Careless Hauling.

"Having picked and packed their fruit some growers resurrect the most unique rigs for transporting it to the shipping point. In many instances there is a failure to realize the perishable quality of the freight. However, in this respect I can say that there have been new wagons in evidence this year and the number is increasing. I saw a some prominence drive in a ago and pull a box of from the back of his rig, down and ask for weight, would make a box out of His care of it was a minus I hate to see good stuff spo that reminds me that with berries there is a whole through the failure to co tire patch each day. Th until tired and then stopp gin the next day where on the first is wrong. patch if it has to be done light. I am not blaming for all this. I blame the do say, however, that if the will study handling metho they will add, in the thousands of dollars to the come.

"Eighteen years ago I w this country and saw the toes I have ever seen. not so much water then. years from now they may grown. Each year, in will see less water used. is used now for the best fr and as time goes by and is available the proportion smaller. However, from view as an expert handler, need now is more qualified take care of the splen grown."

GRAFTING THE CHER

At a meeting of cherry gr Salem last week, E. C. Ar Marion county fruit inspecto on grafting the cherry to an ciative audience. He said in

"Many persons are pla seedling tree with the idea grafting so that the body a main forks will be in the seedling. This I recommend.

"When the tree is pla should be cut off at a height more than twenty inches fro ground. This will form a four or five limbs should b to grow the first year. Th ing spring, three of the be limbs should be chosen as on which to graft the var ed.

"There are several me grafting, but the one whic recommend for the graftin young trees is known as graft. This is made by stock to be grafted at an degrees, making a slit len the limb and parellel to th this cut. The scion is tr same manner, and the each of the parts is then the slit in the other, and ful graft is assured if pr tions are observed in the

"Another method is kn wedge graft, and is on recommend for the This is well known to horticulturists of the needs but little descripti This is performed by limb square off at the e making it smooth with th cut slit is next made th bark into the wood, paralle limb, and following th shape of the limb. Never cut straight into the tree to center, as this is more di heal over. The scion is ne point, and in a wedge into the cut in the limb in manner that the thick part 'edge is outermost.

persons have the idea that- on of the cherry tree is not y. This is an error. The ould be given a thorough, cultivation, which should time to allow the wood to fore the winter season sets

are many old trees in this hat are practically worthless now stand, which, by proper ting can be brought into and be made profitable. I ecommend the Royal Ann or varieties of cherry for they ter than others."—Portland n.

HE CODLING MOTH.

attending the horticultural at Portland two weeks ago ntally got in conversation old man from the Santa lley, California. He claimed orchardist of twenty years' e. He told me of a novel handling the codling moth, hrough the columns of the ter, I give to the orchardists River, hoping that others nyself will give it a trial. is: After the first codling ray, which must be thorough- take a sack, such as we use grain, etc., soak it for two y from 4 to 6 P. M., in ap- . Just before dark hang the to an apple tree (right end a string to each side of the so that while the opening is it will not exceed one-half width. Wring the sack efore hanging. As is well he codling moth gets in her ring the night. The cider her to the sack, the narrow urnishes a place to crawl in, narrow opening prevents flying out and she is also to crawl out. So when you sack in the morning if no moths in the sack there In that part of your or- ith this method only one codling moth is necessary. Kerr, in Hood River News-

k the writer of the above is "off" on the statement codling moth is a night we believe the contrary has en and all night moth ave failed to show any ma- ntage of codling moth.

ED OR BUDDED STOCK.

years ago there was a great riving in some sections to t of a hue and cry, over the nerits of whole-root, piece- ted and budded trees, says try Gentleman. The ques- e relative value of budded ted trees has been so often ar- t results are pretty well estab- is now everywhere accept- fruit growers, with few ex- that one nursery tree is good as another without to the method of its propagation. That is, if we compare 100 grafted trees with 100 budded trees, the two lots being of the same age, size and weight, all clean and healthy, there is absolutelly no preference for one lot or the other from the standpoint of the tree planter. The same comparison could be made between a whole-root and piece-root tree.

There may be considerable differences at times between the different methods of propagation, considered from the standpoints of the nurseryman. In some sections and with some varieties it is cheaper to propagate by budding; in other sections it is often cheaper to propagate by grafting. Growers in the Eastern States particularly believe that they can grow bigger and better nursery trees by budding than they can by grafting. This, of course, means that they have more first class trees in a thousand and sell them at a higher price. The way in which a tree is propagated, however, makes absolutely no difference to the man who plants it.

RUSSIAN APPLES.

A number of years ago there was quite a stir over the introduction of a number of varieties of Russian apples. The idea in introducing these apples was to secure varieties that would stand the severe climatic conditions of the western plains. It was known that the apples of the Russian plains had developed physical pecularities that enable them to withstand the severe and sudden changes in weather peculiar to that country. While this was a desirable feature, the loss in quality and development of other defects more than made up the difference. Alexander is, perhaps, the most widely planted of the Russian apples, but it is also one of the most susceptible to the blight. Arabsko is another one that gave much promise, but it also is very subject to the same disease. None of the Russian varieties so far tried have power equal to the best American varieties. Prof. Budd of the Iowa station introduced a number of these varietiese some years ago, and, after a fair trial, the Iowa horticultural societies reported that they had been the source of great loss to the growers of the State.

BOILED DOWN.

Taking infinite trouble is an art, whether you paint a picture or dust a room.

Be true to yourself, and live up to your best impulses.

Don't look for trouble with an X-ray; it will find you soon enough, never fear.

Your row won't seem so hard to hoe if you will consider the other fellow's row.

The man who has a perpetual grievance has moral small-pox; at least every one wants to get away from him.

A hobby is a good thing, but do not insist upon riding it at all times and places.

THE SAMIAN LETTER.

The letter Y is called the Samian letter. It is so called because its Greek original was referred to by Pythagoras, the philosopher of Samos, to illustrate how deviation from the straight path of virtue becomes constantly wider as the lines are extended. The poet Pope refers to this idea in the lines:

When reason, doubtful, like the Samian letter,
Points him two ways, the narrower the better.

With the Citrus Growers

MINOR CITRUS VARIETIES.

THERE is but slight demand for the various varieties of small oranges or those of the Tangerine types, either for commercial or domestic purposes. When a person is orange hungry, nothing fills the want as satisfactorily as a large, luscious Washington navel or Valencia. Nevertheless, a nice Tangerine now and then is a relish, but one or two will usually suffice.

Dancy Tangerine is the variety usually planted, it being handsome in appearance and very prolific. It grows well on the regular sweet stocks. The tree will grow to be large and one tree in the home orchard is abundant. The Satsuma is an orange of this type and ripens earlier. It has a much thicker rind, and taken all in all, it is not as good as the Dancy Tangerine.

St. Michael is a good orange for the home orchard and comes in between the navel and Valencia. It has a very thin skin and is full of juice and high flavored. It is a good commercial variety and in its season has brought the grower good returns.

The Kumquat oranges are quite ornamental and while not edible direct from the trees they make an excellent preserve. They may be fermented in salt water till the bitterness is destroyed in the rind when they may be preserved or crystallized. There are two varieties of Kumquats, round and oval.

REPLACING ORANGE TREES.

It is often desirable to reset trees in an orange grove that has reached the bearing age, and if the orchard is not over five or six years old it is not a very difficult matter if proper measures are taken. When an orchard gets to be twelve or fifteen years old, we doubt if it is wise to reset trees singly. The roots of the old tree have already taken possession of the soil and they are using it to the best advantage. Success in establishing a small tree in such a location is a question of food and water. When well grown trees are two to three years old, their roots intermingle and the older the trees, the denser the root mass becomes. The entire space where the new tree is planted will become completely filled with rootlets before the end of the first year. This will make it easy for the older trees to rob the newly planted tree.

The best method to pursue is to fertilize the soil well in a large hole, one three feet wide and deep. A few cow heads from the slaughter house placed in the bottom of the hole with a liberal supply of well rotted stable manure worked in the soil that is used to refill, will give a supply of plant food that will stay with the tree for a couple of years. It must be borne in mind that food enough must be supplied to satisfy all the trees surrounding the newly planted one. A fertilizer rich in nitrogen should be used. Enough water must be supplied at all times.

A two-year-old tree should be selected. One that is strong and vigorous and with a large ball of earth. The tree should be removed to the shade of a building or under the shade of a tree and well wrapped around the ball with sacks and kept moist for a week before planting in the orchard. Do not remove any more of the top that wilts down when under shelter. When it is removed to the hole, give it an abundant and constant supply of water with a nitrogenous fertilizer applied as described for field planting in a recent issue.—J. W. M.

IN FLORIDA ORANGE GROVES.

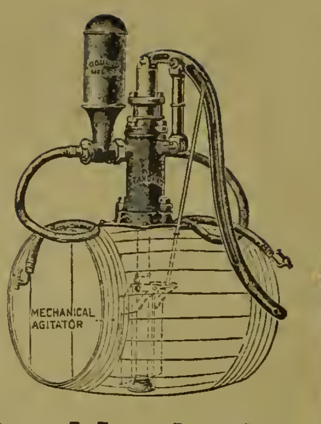
Under ordinary conditions the Florida orange season would at this time be nearly ended. But owing to the great drouth of the winter and spring of the last year, the blooming was abnormal, continuing from February until July; consequently there are yet many oranges not mature, the amount of these being estimated by some persons at about a million boxes says a correspondent in the Country Gentleman. This will prolong the shipping season probably until next summer. Those which come from the late bloom are not as good as those which come from the normal bloom. The rind is thicker, and they are not as juicy and as sweet. It was anticipated that the crop being quite a short one would command good prices and prove a fairly profitable one to the growers. But this expectation did not materialize. The first oranges shipped brought good prices, but as soon as the financial panic occurred, prices dropped, and so far have not reacted.

The beginning of the new year finds the groves generally in fine condition, and a good crop may be expected. The winter so far has been very mild, with plenty of rain. Ice has been sent here but once this winter. It is just cool enough to keep the buds in abeyance. Unless cold weather comes very soon, the bloom buds will begin to appear within ten days or less. It is very rare for the orange buds or bloom to be killed by cold.

White Fly.

Since the recuperation of the orange industry in Florida, the greatest discouragement that has been encountered by the growers has resulted from the general diffusion of the White fly. While it does not infest all the groves of the State, it is generally diffused throughout all sections, and it cannot be long before it will be found practically on every tree in the State. Spraying to destroy the White Fly is generally admitted to be a failure, for it is absolutely impossible to wet every leaf. The leaves are very thick on the trees. The fly lays its eggs on the under side of the leaves, while the upper surface of the leaves is covered by a black, sooty film. In this, the northern belt of the orange zone, the trees are only eight years old from the last freezing in 1900, and, consequently, much smaller than they were before the great freeze. Owing to this, it is found that spraying does much more good than it did to the large trees. But very little spraying is done anywhere in Florida for the White fly.

More reliance is now being placed upon the fungi for checking and destroying it. Two species of fungus, the red and brown, have been known and prized for their destructive work.



Double-Acting Sprayer

With 3-inch brass-lined cylinder, brass-encased outside-packed plunger and brass valves. Large air chamber and long lever. Powerful enough for two leads of hose and four nozzles. Can be placed on end or side of barrel.

Complete outfit, including Pump with suction pipe and strainer, one 25-ft. lead of 1-2 in high pressure spray hose, 6-ft. iron pipe extension and one Seneca spray nozzle (no barrel or agitator) packed ready for shipment for $12.75.

In ordering state whether you want sprayer for end or side of barrel.

This combination is ap, and is nearly transparent. of course, be applied while A heavy plaster of fresh cow ɔound about the trunks is also sfactory if a sufficient amount btained.

The gum disease situation in some of the worst affected districts is very hopeful, and it is largely due to drainage, exposures of bud unions, and a thorough spading of the soil about the trees directly after the rainy season and as often as it is necessary to prevent it from baking and becoming hard, at the same time allowing air to penetrate to the feeding roots and prevent the soil in which they are embedded from scouring, this is probably the most important factor of all. While conditions producing this disease here are not entirely analagous to those of other sections, especially in the matter of under drainage, yet there is much to be learned from their work. No other cause is at once so vital and difficult to overcome as lack of drainage and I believe that the difficulties here can be even more easily and effectually surmounted than where this is the chief cause. Much work has already been done here, and much of it promises to be very satistory. It should be extended to every grove where this disease occurs, and every possible effort should be made to remove the cause of it before spring, for it is usually then that new cases appear and old ones spread about the trunks. Where it is necessary to dig down to expose the bud unions, the basins thus made should be filled before they collect rain water. White sand or other sand free from clay is best for this purpose. If desired it can gradually be worked into the soil and thus make it much lighter and less susceptible to the disease.

As usual, preventive is better than cure, and it must become a part of field practice to remove and prevent causes before the disease appears, for a diseased tree is not easily reclaimed to its full bearing capacity. I say "prevent" causes from occurring, because I know of cases in this very association where gum disease has been induced, especially in border rows, on light soils by basin irrigation. Water is certainly not more valuable than trees, and should never be allowed to come into contact with the trunks, much less to be held about them.—From Report of Field Man Jones to San Dimas Lemon Association.

A BORN OPTIMIST.

When little Leander Bassett asked big Leander, his father, what an optimist was, Mr. Bassett regarded him thoughtfully for a moment before he spoke.

"I hope you're going to be one," he said slowly. "You favor your Uncle William in looks, and you've got some of his ways. 'Twould please me mightily to have you turn out like him.

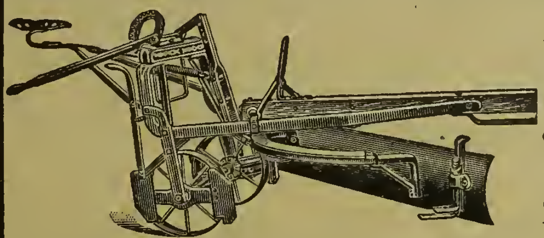
"I don't know how the big dictionaries put it, but I know the general idea, sonny, and it's your Uncle William clear through and through.

"When we had wood to saw an' split he used to call it a kind of a battle. He'd say, 'When we've disposed of this regiment,' pointing to pile o' wood father'd portioned off to us, 'I think our troops will be able to make off to the woods without further interference,' he'd say—and then we'd both hack away like mad.

"When it came to hoeing corn in the hot sun, and I'd got clean discouraged, he'd put his hand up to his eyes and say, 'Strikes me we're getting on pretty fast. When we've hoed these two rows and sixteen more, we'll be one more than half done, and plenty of time to finish.' He'd laugh when he said it, and I'd laugh with him.

"I couldn't always see it the same way he did, but I learned one thing—you can look right at any hard, disagreeable job till you can't see anything else, even when you turn away from it; or you can look through it, no matter how thick 'tis, same as William did. He was what I call an optimist."—Exchange.

Make Roads Easier with One-Man Grader



Those big costly road machines have stopped thousands from making the roads better in their sections. But now they can get a light, easy-to-pull grader and do the work quickly, cheaply, easily. One man and a team can do almost every job with no fuss or trouble. Machine weighs only 600 pounds. It is the

CONGO NEVER LEAK ROOFING Always Dry and Tight!

Study the subject of roofs. Send for catalogues; ask questions; investigate. We give you this advice because we feel sure that after you have looked into the matter thoroughly you will decide upon Congo.

Congo can stand the *minutest examination*. In fact, we urge this method for our own good as well as the consumers', because it increases trade and makes for us life-long friends.

Congo deserves its leading position among ready roofings, because it has all the qualifications needed in a durable, waterproof roof.

If you have a leaky roof, you can appreciate how annoying and expensive it is. Congo avoids all this.

These are facts well worthy of consideration, and if you put up a new building, or if your old roof gives trouble, use Congo. Congo can be laid right over an old roof, and you can do it yourself. No special tools or skilled labor required.

Send for Free Booklet and samples and see for yourself.

THE PURPLE SCALE PARASITES.

The recent introduction of the parasite from China which is expected to do good work in subduing the purple scale, was at first reported to be doing great work in Orange county. We recently noted the following in the Anaheim Gazette, which indicates some time will expire, in the opinion of one grower at least, before the purple scale is entirely wiped out by the parasite.

Mr. Wm. McLaughlin, of Anaheim, is the writer and he has been a close observer of the work of the parasite.

Editor Gazette: For fear orange growers will be misled by an item which appeared in Saturday's Times, I take this opportunity of stating that the parasite for the purple scale that was imported from China is not doing as well as I had hoped, the flies were liberated in but one tree in my grove. While we can find some work of the parasite on that one tree, I cannot find any on any other tree in the grove.

It may be in a few years, after they become acclimated, they will do the work in a satisfactory manner, as was the case of the scutelista's work, but I would not like to see the ranchers give up fumigating on account of the glowing account of the new parasite's work. To my knowledge there has not been a horticultural commissioner in my grove since the flies were liberated. I only wish they would take a little more interest and help us to at least keep the scale pest under subjection. After living in Riverside where the supervisors and commissioners both take such great interest in keeping the groves clean and obliging the owners to do their part, it seems to me very strange to note the little interest taken in Orange county.

Pumped by
The New Pomona Deep Well Pump Head
Pomona Mfg. Co., Pomona

POMONA MANUFACTURING CO., Pomona, Cal. Riverside, Cal., October 8, 1907.

Gentlemen:—In reply to yours requesting privilege of photographing our pumping plant which you installed for us last spring will say: You are perfectly welcome to take as many photos as you wish, and as our season for pumping is practically over, it may be of interest to you to know something of what we have been doing with it. We have raised forty inches of water about two hundred and fifty feet, delivering it through a six-inch pipe line to our reservoir about one and one-half miles distant from the well. The pump is driven by a forty-horse power electric motor, and our tests have shown the actual horse power used to be twenty-seven horse power. The pump has worked perfectly all through the season and is in perfect condition today. It has come up to all that you represented it and met our every expectation. Should you wish to refer to our plant at any time, you will always find it open for your inspection. Yours truly,

RIVERSIDE ARTESIA WATER CO.,

—Industrious Hen.

BEES AS FERTILIZERS OF FRUIT BLOSSOMS.

The Ontario Agricultural and Experimental Union, with over 7000 experimenters, consisting of many of the best agriculturists in the province, at its annual meeting at the Ontario Agricultural College, Guelph, Dec. 9 and 10, passed a resoluion requesting the Minister of Agriculture to arrange to have a series of experiments carried out to determine the value of bees in the fertilization of blossoms such as fruit, clover and buckwheat. Prof. H. L. Hutt, B. S. A., Horticulturist at the college, is strongly impressed with the value of bees for his line of agriculture. He gave the following extract from his recent report to the Fruit Experiment Station Board:

In the first place, the weather has been exceptional. The winter was not severe, and fruit trees, as a rule, wintered well. Bloom was abundant; but during the time the trees were in bloom the weather was cold and windy and unfavorable for the working of bees, which are the most active agents in the pollenation of the blossoms. In fact, there were only two bright warm days, and these several days apart, during the whole season of bloom when the bees worked at all freely. Mr. Murray Pettit informed me that he noticed two distinct settings of the fruit on his cherry trees, which he believed corresponded to the two good days the bees had for pollenation.

In the second place, there was an unusual scarcity of honey bees this year to do all the pollenation necessary to the setting of a full crop of fruit. I was informed by a leading beekeeper that not more than 20 per cent of honey bees of the province were wintered successfully last winter. This being the case, it is easy to understand the effect that a scarcity of bees with unfavorable weather for their work had in giving a light crop of fruit. I have noted repeatedly in various parts of the province that some of the most productive orchards have been those in which honey bees are kept, and there is no question in my mind but that it would pay fruit growers well to keep a few hives of bees merely for the purpose of insuring fertilization of fruit blossoms. In sections where fruit farms are close together, as they are in the Niagara district, the growers within a radius of one or two miles might co-operate and employ a competent beekeeper to look after a good-sized apiary.

LIQUEFYING HONEY.

An ideal way to liquefy honey is to bring the entire mass all at one time to the proper temperature. While this is scarcely practical, yet present methods may be much improved. With ordinary methods there is danger of scorching the honey on the outside of the mass while the center is still granulated.

You know that the best way to melt beeswax is to allow it to run away from the solid part as fast as it melts. This principle, I am sure, is the best for liquefying honey. There are many, however, who can not do this; but there is a method that almost any one can follow whereby a great difference between the temperature of the center of the granulated block and that on the outside can be avoided. This method will also reduce the amount of work necessary, and the danger of scorching the honey nearest the source of heat is lessened. Such a method consists in keeping the honey in a warm room (the warmer the better up to 100 degrees,) until the very center of it has the same temperature as the room. A comb of granulated honey put into a hive with a strong colony in some position where the bees will have no desire to replace it with brood, offers us a fine object lesson in liquefying honey. Exposure to a temperature not higher than that of the hive brings it back to the liquid state, and does not impair the quality.—Gleanings.

Malthoid Roofing

You can't afford to take chances on a leaking roof—besides the actual damage it causes, there is no peace for the landlord or the tenant.

Insist on Malthoid and you will have a roof that is absolutely water and weather proof for years to come. Malthoid is the roof that makes good because it is made by the original makers of ready roofings—

OLD FASHIONED HERBS.

Plants embraced in the general terms of "pot herbs" and "sweet" herbs, are those whose foliage contains some aromatic principle useful in and incidental to cookery, the most important being perennial and herbaceous plants of easy cultivation. A few annual kinds are grown occasionally, but the herbs generally cultivated for home and market are sage, thyme, mint, savory, marjoram and hyssop. The first-named is the most popular and generally grown. Large quantities of herbs are produced by market gardeners, several of whom devote most of their time and area to the cultivation of the plants. At all seasons of the year there is a demand for the produce. In spring and summer the herbs are sold in a fresh condition, while at other periods dry herbs only are available.

In market gardens herbs are usually grown in a portion specially reserved for their culture, a plan to be generally recommended even in very small gardens, as the plants occupy a given position for several years as a rule, and should be considered as outside of the rotation and ordinary culture of vegetable crops. A limited area well prepared and tended will produce a quanaity of foliage of good quality sufficient for an ordinary household, while with a much greater quantity of plants scattered about the garden, more or less neglected, a shortage often occurs. It is generally understood that coarse growth is undesirable, the aromatic qualities peculiar to the various plants being present in a lesser degree in gross growths and leaves than those cut from steadily grown and well matured plants. Sufficient root-room, plant food and moisture should be provided to allow a full development of the plants.

The best plan to adopt for home gardens is to select a piece of ground of a size according to requirements, and devote it to herb culture. A narrow border alongside a fence or path is generally found suitable, but it must not be beside a hedge, or large trees, or the plants will suffer unless well manured and watered during the summer. In many gardens the herb ground is tended as carefully as any other portion, and is usually neat and attractive, the plants being set out in rows and neatly trimmed as required, well cultivated and often margined with parsley or thyme. A few minutes hoeing occasionally, or a mulch of manure is sufficient to keep most of the plants in steady growth, and a thorough soaking with water during exceptionally dry weather followed by cultivation when the surface is drying will insure a plenteous supply for the whole year in either a fresh or dried condition.

Thyme and Sage.

Thyme and sage are dwarf shrubs, and are propagated from divisions of the old plants, cuttings or seeds. As a rule the plants are divided and replanted every third year, the central portions being discarded and the outer and most vigorous shoots with roots attached being selected for replanting. Cuttings of firm shoots inserted in sandy soil in autumn root readily, but do not produce as much foliage for cutting as divisions during the first season. Autumn is the proper season for dividing and re-
planting. Sage is often rai

ABOUT HYDRANGEAS.

The Chinese Hydangea when well grown is elegant as a specimen, and makes a fine show in a tub on the lawn. It thrives either in sun or partial shade, and likes an abundance of water while growing and blooming. If you want pink flowers apply once a week moderately strong manure water. If you prefer blue flowers strictly avoid manure water and use instead applications of alum water, and stir some iron fillings into the soil. Remove any suckers that appear while the clusters are developing. After the flowers become shabby cut the stem close to the ground, and new shoots will soon spring up. Winter in a frost-proof place, watering sparingly. In spring cut the shoots back to an eye, and the growth will be shorter and develop much larger clusters of flowers.

Planting Beans. Courtesy S. L. Allen & Co., Philadelphia.

ASPARAGUS OR LACE FERN.

This is the name often given to Asparagus plumosus. When the plants seem inclined to make one long vine rather than a bushy growth, nip out the center when the shoots attain the height of a foot or eighteen inches. Sprouts will then appear from the roots or the nodes of the stem. If a plant fails to grow satisfactorily shift it into a larger pot and add porous fibrous loam for the new roots to penetrate. The great beauty of this exquisite foliage plant warrants all the care that can be bestowed upon it. It is really one of the most charming of foliage house plants, and should be one of the first chosen. It has no enemies; its culture is simple, and its propagation is readily affected by seeds, which come up with certainty after they have been in the ground for from three to four weeks.

The note in last week's issue that Imperial valley was planting a thousand acres of cantaloupes, was an error and should have read that the entire valley is planting over 8000 acres, which is more than six times its total acreage last year.

Irrigation and Fores

EVERY ACRE OF FOREST RESERVED.

At one stroke of the Lieutenant-Governor's pen 150,000,000 acres of forest land in British Columbia have been placed in reserves. This includes every acre of the province's timber lands, except what has been leased. This is as much land as was put in the National Forests of this country between the years 1891 and 1907.

The action was taken to check wasteful exploitation of timber resources and to bring the care and cutting of timber more effectually under government control.

The province has been leasing timber land instead of selling it. The most of the leasing has been done in the past three or four years, and Americans hold the largest part of the 10,000 leases now in force. The lease is, in its effect, a long-term option at low rate. It runs twenty-one years, and may be renewed at the end of the first term.

The lessee pays twenty-five cents a year until he is ready to cut the timber, when he pays a royalty of fifty cents per 1000 feet, board measure, for the timber removed. The income of the province from leases was about $1,275,000 last year.

British Columbia is the latest of the great softwood timber regions to be invaded by lumbermen. The Puget Sound region is still at top notch; but holdings are hard to get, and buyers and speculators have crossed into British Columbia. While there are many rich stands of timber in the province, it is doubtful if the forest woods furnish a cut of more than 100,000,000,000 to 150,000,000,000 feet of lumber—less than this country uses in eighteen months.

A recent issue of this magazine reported the new forest laws of Colombia in South America. That country's northern namesake is not to be outdone in gripping the treasure while it is in hand.

British Columbia does not permit the export of logs cut on provincial land. They must be sawed by mills in the province, which evidently intends not only to take care of its timber, but to make the most out of it. An export duty has been seriously considered by the Dominion Government for all the provinces of Canada. It is apparent that British Columbia will not be slow to take any advantage which the further diminishing of the timber supply of the United States may afford her in the lumber trade.—Forestry and Irrigation.

THRIFT AND IRRIGATION.

William Howard Kirkbride tells in the March "Century" what one man, an engineer, broken down by long, confining work, is accomplishing in Clarkson, Wash., on one acre of land. Joseph Lipe bought a one-acre ranch with a small house and a few fruit trees on it:

"The first few months he passed in experimenting, drawing upon his pension for living expenses. He read all that he could find upon the subject, talked with men who had made a study of irrigation farming and went among those of his neighbors who were successful, working in the fields with them. He saw that the climate, soil and natural conditions were favorable for agriculture in all its diversified forms; he saw the re
tained through the practical
of scientific methods, and t
ligent effort and careful su
were what counted, not the a
land one possessed. So he

Spray with weak kerosene emulsion.

Alfalfa.

The alfalfa in some portions of my meadows makes a poor yield of hay. Will it pay to apply nitrate of soda and disk it in?—S. W., Imperial.

It is impossible to give treatment without knowing more of conditions. But do not think nitrate of soda would pay. Alfalfa gets its nitrogen very easily. We imagine the disking in of stable manure on those spots, to give better mechanical condition of soil, might be beneficial.

Fungus on Grape Roots.

I have twelve acres in Mission vines five years old and grafted to resistants. I enclose specimen of bark which is indicative of the condition of nearly all my vines just below the surface of the earth and extending downward almost to the base. A great many of the vines have no bark from the surface down. Will you kindly inform me if this is a disease, and if so, please give diagnosis, symptoms and treatment?—Amateur.

The above with the decayed bark samples, were submitted to Prof. Ralph E. Smith of the Whittier laboratory, and he writes:

From an examination of the specimen enclosed with your correspondent's letter showing the trouble with grape vines, it would appear that the vines are affected with the root rot, or so-called "oak fungus," or toad-stool disease. This condition is brought about by a toad-stool-fungus, which grows into the bark of the root or of the stem below ground, causing its decay and the death of the vine. The disease is common on various kinds of fruit trees on land where oak trees have formerly stood, and it is the general opinion that the toad-stool fungus develops on the old oak roots in the soil and spreads thence to the fruit tree or vine. This idea is apparently founded on fact.

There is no effective remedy whatever than can be suggested for this trouble. It affects almost all the common fruits and cannot be checked when once started. The pear seems to be the most immune of anything. If the affected tree is removed with as many of the roots as possible, digging out a larger hole and filling it again with fresh soil from another place, the trouble is sometimes overcome, although frequently the new tree perishes like its predecessor.

Slicker Coat Leak.

For the information of the subscriber who wished to stop the leak in his slicker coat allow me to suggest that boiled linseed oil painted on with a brush, the same as of painting on wood has fixed my coat nicely for three years now. After oiling

SEEDS We Grow Them—YOU SOW THEM

If interested in a quick growing valuable tree you can plant on unused ground read the following about

ACACIA MELANOXYLON

Baron Von Mueller, in his "Select Extra-Tropical Plants," writes of this tree:

"This well-known Blackwood of our river flats and moist forest valleys. In irrigated glens of deep soil, the tree will attain a height of 80 feet, with a stem several feet in diameter. The wood is most valuable for furniture, railway and other carriages, boat-building (stem and stern posts, ribs, rudder), for tool handles, crutches, some portions of the work of organ builders, casks, billiard-tables, pianofortes (for sound boards and actions), and numerous other purposes. The fine grained wood is cut into veneers. It takes a polish, and is almost equal to walnut. Our best wood for bending under steam; it does not warp or twist."

The great billiard-table firm of Alcock & Co., in Sidney and Melbourne, have been making tables from it for the last eight years, and at the exhibition of 1888, there was a piano cased with it which was as handsome a piece of parlor furniture as one could wish to own. The Martini-Henry Rifle Co. have been using it for gun stocks for the last fifteen years, because they could get it much cheaper than the French walnut hitherto used by them.

We have a fine lot of these trees, which you will find priced on page 73 of our 1908 catalogue, mailed free, on request.

Box 12 Fresno, California, USA

hang coat on line for two or three days or until well dried. It works like a charm.—C. E. Hinds, Los Angeles.

Fungus from Trees.

What mixture would you use for spraying prune trees to remove moss? And how is it prepared? Also the preparation for fungus on pear trees and oblige.—B. K., Coclistoque.

The lime, sulphur and salt is good, or if this is too much work to mix a simple caustic solution put on before the leaves start will accomplish results. The strength should be about six gallons of water to one pound of concentrated potash or caustic soda.

Planting Tree Seed.

What time of year is best to sow? How old should seed be and under what conditions will seeds of the following trees best germinate? Blue gum, pepper and cypress.—J. M. B., Anaheim.

August is best. The young plants will then be ready for the next spring's planting, and the seed or young plants require less attention than if planted at this time.

Lupine.

I send under separate cover a plant. I would like to know what it is and whether it has any value as a soil builder. Please answer through your valuable paper.—John Frater, Greenfield.

The plant is the Blue Lupine—Lupine hirsutas. It is excellent as a soil builder. The roots of the plant which you send were covered with the little nodules showing its nitrogen-gathering power.

Tree Props.

Can you tell me where I can obtain tree supports or the attachments to put on stakes, made of wire or solid metal.—J. H., Nordroff.

J. K. Woodward, of Riverside; also the Hoyt Tree Prop Co., of Watsonville, handle supports.

Cuttings True to Parent.

Will you be kind enough to give me information in regard to olive cuttings. I have rooted some made from a Manzanillo tree. Do they have to be grafted or budded to produce fruit of the same variety?—A. J. O., Fresno.

They do not. Seedlings may vary, but any cutting is always the same as the tree from which taken.

Aphis on Strawberries.

I have several acres of strawberries attacked with a blight; when it first makes its appearance it resembles the rose bush blight, and then turns to a small, white fly which hops and flies. The leaves wither and curl and die. Do you know of a remedy for this disease? Enclosed are some of the affected leaves.—Subscriber.

This is an aggravated case of plants attacked by aphis. Although we have more or less of it every spring, it has not been serious. I do not remember to have seen the strawberry so badly affected as these sample leaves indicate, although I have seen as bad or even worse on melon vines. Four years ago I had an acre of strawberries that were badly infested with aphis just as the fruit began to ripen and after a careful examination I concluded if they did not disappear within a few days I would not attempt to market the fruit, for I did not care to injure our reputation for extra fine fruit. On looking over the grounds a day later I thought I detected quite a decrease in the numbers of the pest and within three days they had entirely disappeared.

I know of no practical remedy that can be applied on a large scale. Any form of tobacco is death to the whole aphis family, but the difficulty is in finding any practical way of applying it in open field so that the entire plant can be reached. It is possible "Subscriber" will find, as we do, that a little later in the season they will disappear—destroyed possibly by some parasites or atmospheric influence.—Q. A. L.

Fertilizers.

I would like to ask you a few questions about fertilizers. Is it too late in the season to use barnyard fertilizer on an orange grove to help next crop? What do you think about nitrate of soda to be used this time of year as a fertilizer? Do you think its use prevents the young oranges from falling off? The grove has been neglected and we want to use the best to get the best and quickest results. Soil is heavy, but considered good.—P. M., Charter Oak.

We would use the stable manure by all means and at all times and at any time when it can be secured. For immediate results the nitrate of soda is, of course, preferable. The manure, if thoroughly rotted, would soon become incorporated in soil and gradually become available to roots. If not rotted it will take much longer.

Many growers think the nitrate of soda is excellent to give vigor to a tree and cause it to hold a greater proportion of fruit. You will make no mistake to give an early, light dressing of the nitrate. If the grove has been neglected, follow the nitrate dressing with all the stable manure you can afford, then green manure next fall.

Kaffir Corn.

Please give what information you can in your valuable paper in regard to Kaffir corn, when and how to plant and how much irrigation is necessary.—A. L. Smith, Delano.

Plant same as Egyptian corn and as soon as danger of frost is past. You can drill in and cultivate and irrigate or sow broadcast and flood like alfalfa, if your land is contoured and you have sufficient water. Many Imperial valley growers follow this method.

$25,000 Reward.

I have been informed by growers here that the Walnut Growers' Association offer a reward for an article that will cure the blight on walnut trees. Can you give me any light on the subject? Who should I take the matter up with?—Subscriber.

It has been persistently rumored that a standing reward of $25,000 is offered for a cure for the blight. It would mean so much to the industry that several times that reward, as great as it is, could well be offered. The belief that a remedy would never be found is so general that we believe the twenty-five thousand has never been gotten together. In fact, the most intelligent walnut growers assert that a remedy is an impossibility. However, should any one be so fortunate as to discover the remedy, we do not question that the various associations would soon gather together the money. The

ypsum or land plaster.
is too big a question to answer in
query columns, or even in this
er, but later more attention may
given to it. It is quite fully dis-
sed in "Soils," by Hilgard.

SOME SILLY ARGUMENTS.

ll sorts of criticisms have been and
being hurled at the parcels-post
posals. The latest is that it pays
y in countries having a small area.
example, the Irrigation Age com-
es the British Islands with Ohio,
iana and Illinois, which latter are
00 square miles larger than the
tannic Islands of His Majesty King Edward, says a writer in Gleanings in Bee Culture.

These critics forget that the British parcels post extends over an area three times as large as the United States. It embraces Canada, West Indies, Australia, India, South Africa, Central Africa, and various other colonies, so that this criticism has no foundation on which to rest.

In the instance of France, the case is not much different. The word "France" includes Algeria, an immense country, the French West Indies, and Indo-China, an area of land as large at least as the United States. But we can go nearer home, for Uncle Sam has a parcels-post service with many countries. We have every reason to believe this service is done in first-class style and at much lower rates than any express company would do it; and a curious fact in this connection is that the foreign rates for parcels post are lower than the domestic. To make this clear we will instance an hypothetical case. If one wants to send four pounds to a customer in this country, the charge is 64 cents; but if the customer lives in Central America, or some other far-away country, the charge would not exceed 48 cents.

Some California Vegetables.

Courtesy Johnson & Musser Seed Co.

We understand that Senator Platt, who "owns" two express companies, has already boasted that there would be no parcels-post legislation at this session of Congress. It would go through a good deal sooner if the farmers would give their Congressman to understand that they fully expect him to do all in his power to help this reform in our postal laws, for it is only a reform, nothing more. We have parcels post already, and have had it for years; but the rate is too high for it to be a success. It was purposely made so to suit the express companies; but the necessity for protecting their business has long since ceased to exist.

The Cost of Parcels Post.

One of the stock arguments against the parcels post is its cost, and quite a number are being misled into the belief that it will result in a great postal deficit. Now, what are the facts? Great Britain, with an immense business at very low rates, has an annual postal surplus now of not less than $20,000,000, and in one instance we believe it was $35,000,000. Germany also has a very liberal parcels-post arrangement, and her annual surplus over all expenses is nearly $15,000,000. France usually has a postal surplus of something like $10,000,000, though she too has liberal parcels-post facilities.

It is the United States which has always a postal deficit which Uncle Sam's treasury has to make good. Parcels post would, to a very great extent, stop this deficiency, and put the postoffice on a paying basis. Many small postoffices would begin to pay or hold their own if we had a true parcels-post system such as a great nation ought to have.

In any event, the bee-keepers have a use for a parcels post; so have the egg-raisers; and even the butter-makers can despatch their goods by parcels post to customers. We are going to have it.

Parcels Post in the Senate.

Senator Burnham of New Hampshire, on Feb. 10 introduced a bill in the national Senate authorizing a parcels post on rural routes. The bill has the endorsement of President Roosevelt and Postmaster-General Meyer. It provides for a rate of 5 cents for the first pound and 2 cents for each additional pound. The limit is 11 lbs. On the same date Senator Kean, of New Jersey, introduced a bill providing for the lowering of the present parcels-post rate from 16 to 12 cents, and increasing the maximum weight from 4 to 11 lbs. It seems to us the rate of 12 cents is oppressive, and might with great propriety be reduced to 8 cents per lb., and probably a flat rate of 5 cents would pay the best of all.

CRANE FLY DESTROYS CROPS.

The department of agriculture has received for the past two months reports from various parts of the State of the devastations wrought by a certain worm which has eaten the grass and grain roots. Damage has been reported from as far north as Marysville to Mariposa on the south, and from the San Joaquin and Sacramento valleys to a considerable distance into the foothills. The worm seems to take the roots of the growing grain and grass and utterly destroys the crop. Experts of the university have been in the field for some time studying the problem and they report that the wrost of the damage has now been done and things are on the mend. The worm is the larvae of the crane fly. They are at this time practically full grown and before long will become flies and the damage for this season will be over. The crane fly appears to be peculiar to this locality and has occured before. It never has shown itself in such large numbers as this year and there is a strong prospect that it will not recur again next year as it has for the last three months. There seems to be no remedy for the pest, and untold damage has been wrought thereby.

TO BE HAD FOR THE ASKING.

Messrs. Woodin & Little, the San Francisco pump and farm machinery people, are now in their new quarters at 70 and 72 Fremont street. The new quarters are more complete, commodious and comfortable than any occupied by this firm. The store room is completely stocked with centrifugal and other pumps, gasoline engines, wind mills, tanks and other things two numerous to mention. Every farmer should write for catalogue B. It's chuck full of information and may be had for the asking.

The Separator News published by the Sharples Separator Co., of West Chester, Pa., is received and is full of information of cream separator matters. A postal card will cause a coyp to be sent to any farmer asking for it.

General Agriculture

IS YOUR FARM NAMED?

DIGNIFY your farm by giving it a name. There are abundant reasons for it. Amongst them we note the following in a Northern exchange:

Is your farm named?

If it is not, name it as soon as you can decide upon a name, and then have that name painted on an arch over the entrance or some other conspicuous place.

Have some letter heads and envelopes printed with the name of your farm, and perhaps a picture of the building or the thing which you wish to be best known about it.

The fact that your farm is named gives it a distinction apart from the unnamed farms about it. When the editor of your local paper prints an item about you or your products, always have him mention the name of your farm. It will only be a little while until your farm name will be a constant advertisement to your financial good and gain.

Every man, woman or child who drives along the road will read the name and will remember it long after they have forgotten the place otherwise. When they speak of you or your farm products the name will unconsciously come to their minds, and a certain indefinable prestige will come to you through the fact.

Another advantage in naming the farm comes in the additional pride in the place. You will find that the help will join you in the effort to keep the weeds down in the fence corners an along the roads, to keep the gates and fences in repair, the barn lot tidy and the grass in the front lot neatly trimmed. It is wonderful what this element of pride will do for a household, and how it will increase the profits from the farm by furnishing an additional motive to have everything done as it should be.

Again, if your farm is not already named, name it right away.

PAINTING SHINGLE ROOFS.

With the present extraordinarily high prices for all classes of lumber, the subject of employing wooden shingles for roofing is a very vital one of dollars and cents to the property owner. If we are to use shingles, we should certainly take every precaution to make them durable and lasting, says a writer in Country Gentleman.

The house in which I now live was built in 1873 by my father. It has a Mansard roof, covered top and sides with wooden shingles and painted after the shingles were laid. For paint we have used natural graphite ground in oil, applying one coat, on an average, once in five years. This makes an exceedingly durable and satisfactory covering in every way, as the graphite wears well and looks fine, resembling natural slate in color. In fact, so closely does the roof resemble slate that we have had our neighbors remark after passing daily by the house for years that they certainly thought we had a slate roof, and were very much surprised that such was not the actual case.

This roof has been on fully thirty-four years. It has never been reshingled, and is as sound and good today as it ever was. This certainly is an emphatic contradiction of the opinion held by many people that the painting of shingles after they have been laid does not increase their durability. To be sure, it is better to dip the shingles in paint before laying. In this way all parts of every shingle are covered and protected. But the roof in question has most assured lasted splendidly with only painting after laying.

There is no better black paint th graphite for all severely exposed s faces such as roofs. If a red color preferred, use oxide of iron ground i oil. We have within a few years p a shingle roof on another building In this case we dipped all the shingle completely before laying. This makes a perfect job, as, if the roof is oc a sionally painted, the shingles will la well-nigh forever.

Pay particular attention to the nail

used in shingling. What is wanted the old-fashioned iron cut nail. Ne ther steel nor wire nails are dura as they rust in a few years and al the shingles to blow off from the ro Be very careful in laying shingles have good, wide laps. Many supp edly good carpenters are careless this way, failing to cover cracks an nails as they should. Too much pai cannot be taken in putting on a r which is expected to be perfectly ti and dry for many years.

GOOD ROADS AND FARM VALUE

The direct connection between go roads and the value of farm land shown in a striking manner in Bul tin No. 38 of the U. S. Department Agriculture. This bulletin give t results of an ivestigation by the O fice of Public Roads of that depar ment relating to public road milea revenues, improved roads and expe ditures in the United States in t year 1904, and the information co tained therein is of great importan in connection with the movement behalf of the systematic improv ment of the public highways.

The returns from various Stat show that in nearly every case t States having the highest percenta f improved roads have the largest population per mile of road, thus howing that better roads are a powerful factor in encouraging the ettlement of unused lands, especially n sparsely populated sections of the country. Good roads are also an important influence in retaining in the farming districts the desirable elements who might otherwise drift into he towns and cities. As the price of arm lands depends on their produc-ivity, accessibility to markets and population engaged, or desiring to engage, in agricultural pursuits, it follows that road improvement, by attracting additional settlers, and giving them better facilities for reaching their markets, directly tends o increase the values of all farm lands within the radius of the roads improved.

A comparison of percentage of improved roads of the various States shows that the average percentage of the improved roads in all States where farm land is worth less than $20.00 per acre is only 1.9 per cent, whereas in the States where the acreage value is more than $20.00, improved roads constitute an average of 9 per cent of the total mileage.

While there may be minor causes of variations in the value of farm lands it is an undoubted fact that, as a general rule, the higher values of certain States are largely due to their superior roads. Records on file in the Office of the Public Roads show that farm lands have been known to advance in value from 50 to 500 per cent on account of the improvement of the roads connecting them wtih market towns.

When the facts secured by the Department of Agriculture become known to the farmers of the country, and they realize that the establishment of a complete system of properly constructed public roads will have the direct effect of greatly increasing the value of their farms, they will be the foremost advocates of a broad, comprehensive policy of public road improvement by the Nation, States, counties and townships.

Hay is now commanding $25 per ton in Imperial valley.

of Lettuce in Flower.

Courtesy Johnson & Musser Seed Co.

FARMERS' NATIONAL CONGRESS.

The next session of the Farmers' National Congress will be held at Madison, Wisconsin, opening September 24. In several respects it already promises to be the most notable ever held. Although the congress has been a strong friend of the agricultural colleges and has consistently favored liberal appropriations for agricultural education, this will be the first time it has ever met in an agricultural college town.

One of the most valuable features of the 1908 sessions will be the opportunity to see one of the leading and best agricultural colleges of the country and study it and the work of these institutions at close range. Further than that the Wisconsin college has an unusual number of persons connected with it of much more than average ability and reputation. Ex-Gov. Hoard is chairman of the Board of Regents. W. A. Henry, emeritus professor of agriculture, is well known through the country and his book on "Feeds and Feeding" is a household bible in thousands of farm homes. The Babocck test has revolutionized dairying and the word Babcock has thereby become so general that it is used now as an adjective and a verb. Prof. S. M. Babcock, the father of this, is one of the professors at the agricultural college.

Then without particularizing further there are Russell, Farrington, Woll and many others of exceptional standing. The opportunity to see and hear such men, and visit such a college would be, without other features on the program, a rich and unusual treat. But besides all this President Cameron will provide a most excellent program. Taking it all in all this session will be richly worth a long journey and the necessary time and expense. We hope that every one of the Pacific Coast States will be represented by strong delegations.

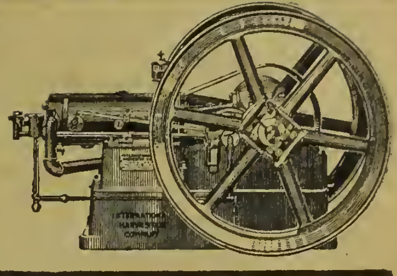
ABSENT-MINDEDNESS.

Customer (to dairyman)—But this is nothing but water that you have given me.

Dairyman—Oh, how foolish! I forgot to put milk into it.

—The De Laval Monthly.

The GREAT AMERICAN DESERT is DISAPPEARING



THE great ranges are fast being taken up by individual settlers, and thousands of prosperous farmers are taking the place of the few cattle kings that were monarchs of the ranges a score of years ago.

It is the story of the magic touch of water upon the dry land.

I. H. C. Gasoline Engines in Irrigation Enterprises.

If you have not kept yourself posted on irrigating matters, you will be surprised at the important part I. H. C. gasoline engines are taking in the reclamation of these waste lands.

Hundreds of settlers and farmers have no other means of getting water upon their lands than these engines.

These settlers and farmers are cultivating all sizes of farms, from garden spots to "forties" and "eighties" and quarter sections and even larger tracts. They are among the most prosperous farmers in the irrigated sections. They are raising grains, alfalfa and other grasses—vegetables, fruits, etc.

They find that with an I. H. C. engine they can get water in large quantities upon their land, and that they can get it dependably and economically. They find the I. H. C. engine method of pumping more direct, more profitable and more satisfactory than any other means heretofore employed.

I. H. C. gasoline engines are simple, dependable and powerful. They pump water economically, and you will find that they run with very little attention.

If you have an irrigation problem it will pay you to investigate and see what an I. H. C. gasoline engine will do for you.

Vertical engines in 2 and 3-Horse Power.

Horizontal engines (Portable and Stationary) in 4, 6, 8, 10, 12, 15 and 20-Horse Power.

Also, gasoline traction engines, pumping, sawing and spraying outfits.

Call on the International local agent, or write the nearest branch house for catalog and colored hanger.

CALIFORNIA FIELD LABORERS.

The ranchers in the northern part of this State are considerably exercised over the attitude of certain Congressmen from California, regarding the question of Japanese exclusion.

As is well known, there are two or three of these representatives who are determined to force an act through Congress which will be so drastic that it will not only result in deporting almost all the Japanese today in California, but prohibit any further immigration. This the ranchers are generally opposed to.

They say when the Japanese are crowded out of the country the farmers will have to depend on a most inferior class of white labor, with the result of immeasureable loss. Bad as Japanese help often is, it is better, as a rule, than "the poor white trash" which floats from the city to the country and can not be relied upon. Said a large ranchman to us recently: "If an exclusion act is passed, the Japanese will leave the country and the farm owner will be left to shift for himself the best he can. With such unreliable help as he frequently finds in white labor he is up against a serious proposition. His crops will rot on the ground about two-thirds of the time, for white labor in California is not a thing to depend on."

Discussing this subject recently, one of our State papers takes strong ground against a hard and fast exclusion act because, first, it is unwise, and second, not humane. We read:

"The sentiment in California is generally broad, just and humane. We wish to see Japanese immigration put under proper restraint on a mutual agreement between the two governments. This is perfectly feasible if on a just basis. We do not wish to see all Japanese persons excluded from this State. On the contrary, we would be glad to see the treaty with China so modified as to permit some of those people to be admitted here. We need them. The Chinese are preferred by our people to the Japanese on their general merits.

But above all, the people of California wish to see any laws that may exist applied in a spirit of justice and common humanity. This desire grows first and most out of a spirit of justice in our people, and out of a feeling of humanity. In a secondary sense we wish to see the laws executed in this spirit in order to cultivate a feeling of friendship between our country and both China and Japan, in order to make trade btween us and them easier."

What interests the California rancher is not so much the question of ethics as the question of expedients. What he will do for hired help if the Japanese are driven from the country.

The Jap is not a pleasant character to deal with generally, but he is more faithful and plodding than the white man in his class, therefore the more desirable as a laborer on the farm. These are the views of nine-tenths of the people of California, in fact, all except the labor agitators whose business it is to stir up contention between capital and labor.

NEW CO-OPERATIVE PLAN.

Down in Maine the farmers are working out a scheme, through the grange, to form a system of marketing farm produce, whereby the commission man's profit may be saved to the producer. It started about two years ago, in several localities, with a chain of storage houses owned by the members of the grange. In these warehouses each farmer keeps his own crops separate and sells them direct to the wholesaler, so that he receives the profit of his own labor. Thus apples carefully packed and graded need not help to sell another's apples carelessly packed and not graded. The association thus handling thousands of bushels of fruit would be able to control the export trade in the State. It is understood that the farmer would be under no obligations to have his crop sold by the association, but would attend to it himself if he chose to, but all produce will be required to come up to the standard set by the association. The scheme originated in the attempt to create a higher standard in the case of fruit, among those who were careless about selecting and packing, and consequently worked injury to the trade as a whole. The plan is said to be productive of good results and to have raised the grade of apples several points.

Carelessness among packers has injured the fruit business in California to an extent which would be difficult to determine. Small fruits especially have suffered, and growers have lost large sums of money because they would not exercise more care in selecting and packing for the market. If some general plan were adopted by producers in this State to compel a uniform system of grading and packing small fruits, much of the honest criticism which now attaches to our shipments abroad would be silenced and our fruit become much more popular than it is today in the eastern markets.

The outcome of the Maine plan of co-operative selling will be watched with interest, and if it proves successful it is likely to be adopted in other States.

TO GRADE GRAIN.

Secretary Wilson has asked authority from Congress to standardize the grading of grain. So many different methods and systems are in vogue, in different markets, it leads to confusion, especially with wheat, corn, oats, rye and barley. In order to bring about uniform methods of grading grain it is first necessary to fix standards, and during the past year laboratory tests have been made with a view to determining proper standards. Secretary Wilson believes that there should be national inspection of all grain entering interstate and foreign commerce, and he has asked Congress to give authority for this. He believes such inspection would be of great benefit to the producer and to the dealer. He says that the producers have suffered through the lack of uniformity in grading, and our markets abroad are injured by lack of confidence in the grades established.

NOT A LOCAL PAPER.

We notice some of our exchanges in the San Joaquin valley refer to the California Cultivator as a **SOUTHERN** California publication. This is erroneous for the Cultivator circulates as extensively north of the Tehachepi as south of it, and our office at San Francisco is as much a fixture of the Cultivator as the office at Los Angeles.

With over 6000 subscribers north of the Tehachepi, an office at San Francisco, and as much space devoted to Northern and Central California as is devoted to Southern California, we naturally belong to the State at large and not to any particular section of it.

WHITTIER INSTITUTE.

The Cultivator goes to press as the Whittier Farmers' Institute is in progress. Next week a general resume of the proceedings of this important meeting will be given. Profs. Wickson Woodworth, Smith, Ramsey and Clarke are present, rendering valuable assistance to conductor Neff. The sessions are well attended and the addresses of a high order.

In the year 1908 let us all see if we can not improve in our methods over 1907, in our moral natures, in our home life, in our dealings with our fellows. In short, carry the thought of improvement all along the line, in our farm homes, in our methods of cultivating, irrigating and fertilizing. This principle of betterment will lead farmers to paint their buildings and fences, to improve their roads, their stock, to make things brighter for the women and children, in short, to make everybody and everything happier. Rowland Hill, the Scotch evangelist, said: "I wouldn't give anything for the Christianity of a man whose dog and cat are not better off for his religion." After all, religion is only a principle of betterment which should be carried everywhere and into everything, bringing, as the Deseret News puts it, "better churches, better farm houses, better clothes, better carriages, better horses, better cattle, and these attained, means better boys and girls, better men and better women.

Shop Talk

"THE PERFECTED POULTRY OF AMERICA."

In the "Book Review" column of this issue and on another page is a description of the above-named book. It is certainly worth the attention of every poultry breeder who pays any attention to quality in his stock and the **CULTIVATOR** is able to supply such breeders with books.

The price of the book is $2.50, but to promote the welfare of the industry we have arranged matters so that for the price of $2.50 we will also give a year's subscription to the **CULTIVATOR**.

The book is beautifully bound and contains such elegant drawings and cuts describing all the breeds of fowls that no well regulated poultry ranch should be without it.

Even the individual feathers from every part of the fowl are shown so every breeder can judge accurately his own birds.

In our offer you receive the book, prepaid, at regular price, and the **CULTIVATOR** free. Either new subscriptions or renewals are accepted on this offer. It is certainly a good investment and we shall be glad to attend to the matter for you at once.

F. J. B., Phoenix, Ariz., says: "Best journal west of Kansas City for Salt River Valley ranchers."

L. B. M., Tulare, remits and says: "I consider this a very profitable investment."

R. H. B., Riverside, says: "Go ahead on the lines you have laid out and you will not lose me."

H. P. D., of Fresno, says: "We like the Cultivator very much and read it with much profit as well as interest."

"Enclosed please find one dollar for which send the Cultivator to my address. I consider your paper the best agricultural paper I ever read. Would not do without it." J. H. B., Corrolitos

M. S. of Summerland says: "The Cultivator is very highly valued by me. I frequently find a single article worth the price of a year's subscription."

he Sonoma County Co-operative ltrymen's Association have es- lished a wholesale egg depot at ta Rosa.

rchardists near Chico are smudg- with oil to prevent possible in- y from frosts to the blossoms of fruit trees.

he State Forestry Board visited Big Basin Reserve recently to de- mine as to the recent contention he destruction of trees.

ne farmer near Yuba City has mitted stock to die and lie ex- ed on the farm until officers com- led a change of conditions.

ut of a total of 21,000 of eggs pro- ed in the vicinity of Santa Rosa Sonoma County Co-operative ltry Association controls 16,000 es.

armers near Redding have been arded $30,000 damages for land ich is to be submerged when a m is built by the Battle Creek wer Company.

he Sacramento valley branch of e Hop Growers' Union at a recent eting at Sacramento adopted a solution calling for a decrease in e hop acreage of 30 per cent.

While the wine trust is advising owers not to plant any more apes at present, it is charged that is greatly adding to its own hold- gs along that line.

Central California

Watsonville schools observed Arbor Day.

Turlock is enjoying an occasional rabbit drive.

Kerman is proving to be quite an alfalfa center.

Salinas Valley has already planted 100,000 acres to grain.

Tulare and Visalia horticultural districts marketed 6742 tons of dried prunes last year.

Turlock cantaloupe growers will put in the largest acreage ever planted in that section.

The cannery at Sunnyvale is preparing for the heaviest pack of deciduous fruits in its history.

The schools of Palo Alto are offering prizes for the best garden work done by children in those schools.

The quarterly meeting of the California State Veterinary Medical Association was held last week at Hanford.

The Salinas Index says that the mountains in the neighborhood of Freemont's Peak show the most snow for years.

Thirty-two sheep shearers at work at Bakersfield have gone on strike, demanding more pay. The former price was 7c.

The San Jose Grange has been giving particular attention to the postal savings banks which it hopes to see established.

Dinuba, Sultana and Orosi raisin growers have formed a pool for disposing of the raisins still in the growers' hands.

The County Horticultural Commission of Tulare reports that there were grown and sold in Tulare county 37,000 citrus trees last year.

The magnificent Rancho Chico, owned by Mrs. Bidwell, has been offered to the State Board of Foresters, and will probably be accepted and converted into a reserve.

The Interstate Commerce Commission investigation has developed the fact that the California Pine Box Lumber Company was given a lower rate on its shipments of box shook than were fruit shippers.

The Watsonville Parajonian says: "The wanton destruction of the big redwood trees with the sanction of the State Forestry Commission is one of the most damnable crimes ever perpetrated on the people of this State."

The Parajo Valley has sold the greater quantity of its potato crop. The shipments in the last two weeks having been far more liberal than formerly. The visit of the fleet of warships is given as a reason for the cleaning up of the crops.

The Kearney estate is now being sued by an architect for $58,000 for services rendered in designing a great chateau which was never built. This will effect, if decided in its favor, the values of the estate, which is now devised to the State University.

Some of the fair circuit dates for the Pacific Coast are: Sacramento, August 29th to September 5th; Roseburg, Oregon, September 7 to 12; Portland, September 21 to 26; North Yakima, Washington, September 28 to October 3; Spokane, October 5 to 10.

Southern California

Coachella Valley shipped its first asparagus last week.

San Bernardino rainfall amounts to practically 14 inches.

Citrus orchardists are busy turning under green cover crops.

Hundreds of acres of grapes are being planted in Coachella valley.

A cannery at Huntington Beach is contracting for next year's tomatoes.

Coachella Valley News appeals for introduction of ramie to that section.

Seventy-five Pistachio trees are being grown at the Experiment Station near Indio.

The Imperial weather has been slightly cool for the best growth of the cantaloupe.

Imperial county will try a new variety of cantaloupe this year known as French melon.

Riverside recently experienced a mild norther which took some of the riper fruit off of the trees.

Cabbage growers the country over seem to be discouraged over the outlook of the cabbage market.

The Curtis silk farms is encouraging interest in silk culture by distributing 100,000 silk worm eggs.

Up to the first week in March the shipments of olives from Hemet amounted to 250 tons or 21 carloads.

Wild turkeys are to be released in the San Bernadrino Forest Reserve. They will be brought from Mexico.

San Jacinto Valley men have formed a corporation to erect a saw mill in the San Jacinto mountains.

Anaheim reports that the next crop of potatoes, both sweet and Irish, will be greater in that section than ever.

Farmers near Oxnard have found the last season so wet that some are considering the advisability of under drainage.

Most Southern California hay growers anticipate a bigger crop than usual and the price is exceptionally favorable.

Santa Ana poultry growers are investigating the possibilities of securing poultry feed at much lower rates in carload lots.

The Imperial Creamery is now paying $15,000 per month to farmers for cream and is making about one ton of butter per day.

Poultrymen of Santa Ana at their next annual show expect to open up with a big parade which will be worthy of a big show.

The shipment of dried chilis from Orange county is proceeding slower than usual. Up to this time shipments have been exceedingly light.

While the season has not been as favorable as last to orange growers and universally lower prices have prevailed, yet there is no discouragement with most growers.

The California Fruit Growers' Exchange recently offered prizes for the best poem regarding the healthfulness of citrus fruits, the same to be used in advertising purposes.

The East Highlands Fruit Association has a new pre-cooling plant which cost about $35,000 and is strictly up-to-date and effective. It will handle about 3½ cars of fruit per day.

The Coast

Dayton, Washington, is shipping flour to Guatemala.

Oregon potatoes are being shipped to Minneapolis markets.

Spring farm work is in full blast at LaCross, Washington.

Pueblo, Colorado, is to be the center of a great tomato growing and canning industry.

At several farmers' institutes held at Utah recently, the average attendance was over 300.

A great deal of new land is being plowed and developed near North Yakima, Washington.

The annual exhibition of the Hawaiian Poultry Association was held in January at Honolulu.

Prospects for a fine fruit crop in the orchards near Pomeroy, Washington, were never better.

The Buckeye country in Arizona is said to be the center of the honey industry of that territory.

Sixty finely bred horses were in the recent parade at the horse show at Walla Walla, Washington.

The effort to secure statistics of hop acreage in Oregon has failed and the effort has been abandoned.

North Yakima orchardists are irrigating extensively hoping to avoid injury to fruit blossoms from the frost.

Hop growers at Salem, Oregon, refuse to join the hop growers' union, as they maintain the effort will be a failure.

Milton, Oregon, stock growers are prosecuting a dealer in stock tonic because of loss to catle after feeding the tonic which it is claimed contain poison.

The brewers are endeavoring to frighten the hop growers with the statement that the present temperance agitation will destroy the hop business.

Portland potato dealers are broken up over the fact that the 7000-sack battleship order for potatoes was secured by Watsonville and Salinas growers.

Hay dealers at Tacoma, Washington, report heavy demands for hay and bran for the Alaska trade, and the market there is kept clean on that account.

The North Pacific Fair Association will arrange the coming district fairs so that the live stock breeders and other exhibitors are enabled to take in the entire circuit during the season.

The farmers' demonstration train, which recently made a trip over the O. R. & N. lines in Palouse country, was received with greatest interest, and is said to have done great good to all farmers.

Farmers near Walla Walla, Washington, are overcoming the weed pest which has been caused by weeds growing on the railroad right-of-way. The weeds are eradicated by growing wheat on this strip.

The Hazelwood Cream Company pays 1½ cents more for cream that shows less than a certain per cent. of acidity. This they call "premium" cream. The firm is endeavoring to educate producers to assist them in creating a gilt-edged article on butter.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

CARE OF CHICKS.

IN OUR last issue we told how to treat the setting hen, so in this we will tell how to treat your chicks from time hatched until they are six weeks old. For so much depends on the care we give our chicks for the first six weeks.

If we are raising thoroughbred stock and expect to exhibit or sell stock for exhibition purposes, we must keep them growing from shell to show room.

Whether we grow thoroughbreds or common stock for market and eggs we force them, and we cannot force them if we mistreat them.

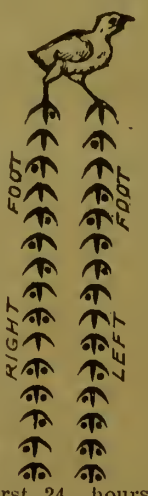
Taking Chicks from Nest.

It is not best to take chicks from nest until they are about 24 hours old. Yet it often happens that some will hatch at least 12 and often 24 hours ahead of others. So we will have to watch our hens pretty closely while hatching, as after the chicks are 12 hours old they will begin to move around and may make the hen nervous, so we should keep close watch in the day time and if the hen begins to get nervous remove chicks either to another hen or put them in a basket in a warm place, putting them back under the hen again at night.

Care should be taken in selecting a hen for mother of chicks, as all hens that set well don't make good mothers. Keep chicks as quiet as possible for first 48 hours. We never feed our chicks till 24 or 36 hours old, but always feed the hen a good feed of whole grain as soon as removed to the brood coop, for if she be hungry she will scratch around hunting for food, when she should be brooding her chicks.

Marking Chicks.

If you want to follow line breeding, as was suggested in these columns several weeks ago, or if you have special matings that you want to mark, the marking should be done when chicks are taken from nests, for they remain under hen pretty closely for first 24 hours; it gives the wound a chance to heal, thus avoiding the danger of the chicks pecking one another where punch is made. The web of foot can be punched with a small punch that can be procured from any poultry supply house.



We give a cut here showing the usual method of marking, each mark representing a different pen or mating. It is possible to make 15 different combinations in the four webs.

Feed for Chicks.

Now that we have our hatched and in coops, we shoul them proper care and feed. V ways feed a special prepared chick food. This can be pur at most feed stores and at all try supply houses, and we found it much better and cl than we can make. If any o readers cannot get a ready chick food and will write us w give a recipe for a good one.

If you can it is best to keep before them always, but it shou fed in troughs that should be so structed that the chicks c get into them with their fee fed on ground, you should feed eral times a day and in a place. After we begin to feed chicks we never allow them t hungry.

Provide Water.

The chicks should always plenty of good, cool water b them. Never allow the drin fountain to stand in the sun. careful to have drinking vessels chicks can't get into them for they get wet and chilled they more subject to disease.

Keep Chicks Free from Lice.

If you have looked after your properly during incubation, you not have to look for lice for the few days. Head lice are one of first things to bother. The most fective remedy for head lice is to a little lard on head at night. T give them a good dusting wit good lice powder or insect pow If you give them one or two g dustings the first four weeks you have no trouble from lice.

Give green food, lawn clippi lettuce or rape. Don't allow hen drag them around through the grass. Provide shade and she from noon day sun and you will h healthy, strong chicks and will surprised at the rapid growth t will make.

* * *

AROUND THE YARD.

Treat the chicks kindly.

* * *

Wash out the drinking fountai

* * *

Whitewash your coops and them clean.

* * *

It doesn't pay to raise chicks cats and rats.

for first three weeks. The heat, of course, will depend on the weather somewhat; it may be necessary to keep up heat for four weeks or longer, or again you may find in two weeks your chicks will not require heat. At four weeks of age your chicks can be put in cold brooder or brood coop, which is nothing more than a box, for protection.

* * *

Possible Injury.

Will you kindly tell me what is the cause and cure for the following conditions of a few of my hens—White Leghorns: They first drop their bodies closer to the ground than normal; their bodies become enlarged and they walk more like a duck than a hen. When first symptoms appear they eat ravenously. One I killed; had in her body a sack of watery substance almost clear in color, of about a pint in quantity. They have wheat and cut grass morning and evening with a mash of bran and milk, and kitchen scraps at midday, with grit and shell and water before them all the time.—Subscriber.

I think your hens have broken eggs in them. This may be caused by birds getting a fall, while trying to get on or off of roost. Sometimes when the male bird is extra vigorous the hens will try and fly away from him thus increasing the danger of a fall. Try as far as possible to remove the cause. For afflicted birds inject a little sweet oil in vent and help the hen pass the egg.

* * *

Canker.

For the past two years have used, very successfully, for roup, a cure given in your columns by a former editor, and for canker sore mouth found a wash of alum water or tincture of iron mixed with oil very effective. But lately the above remedies have failed to give the desired results, and am losing some of my hens. Perhaps I have not diagnosed the present disease correctly. One eye is watery, and if I do not succeed in getting it cured at once the eye will swell and fill with the cheesy substance; the mouth has yellow sores in it and the throat fills with phlegm. In some cases there is an eruption, in appearance like scabs, on the comb or gills or eyelids, the latter, I thought, might be chicken pox and have bathed the sores with vitrol water. In all cases where the phlegm appears, have failed to effect a cure and in a few days they die.—J. L.

Your chickens have canker and chicken pox. Canker in throat and windpipe is hard to cure, and especially so when accompanied with chicken pox.

Our advice is to clean up your houses and yards. Disinfect well and whitewash houses. Get some reliable roup and canker cure and treat according to directions. It will take hard and constant work to stamp out the disease.

* * *

Fleas.

I have a fine lot of White Leghorn chickens; some of them will scratch their heads till blind, others will begin to sneeze, then gap; both will linger several days and die. Please tell me the cause and what should be done for them. They also get dark spots on their combs.—A. M., Reedley.

* * *

I think if you will look closely you will find that your birds have fleas. I have seen the heads and combs of birds covered until they looked like dried blood. Make an examination and if this is the case, anoint head well with vaseline or lard. This will kill all that it comes in contact with. After you have treated birds, clean up yards and houses; spray runs, houses, etc., with four parts distillate too one part liquid lice killer.

Feed the Chicks and Kill the Gophers

West Coast Chick Feed

A full, rightly balanced ration for the little ones, to be fed dry. All pure feed, no filler, no waste. The biggest seller because the best made. Keeps them growing and healthy. For sale by many dealers; if not by yours send direct to us.

Bille's Gopher Poison

is most attractive to gophers, squirrels, etc., but sure death. Endorsed by Agricultural Colleges and Experiment Stations. Has had the greatest success for years in the Middle West, and also here in California last season. Circular with many testimonials and Affidavit of 201 killed in one day. If your dealer hasn't it, send $2.50 for two bottles, (not less than two) express prepaid by us. Money refunded if not as represented—so printed on the bottle.

BABY CHICKS

Buy Day Old Thoroughbred Chicks

The easiest and quickest way to get a start in the poultry business. You can get just the number you desire and at the time you are ready. No delay waiting for the hen or incubator to hatch and no uncertainty as to the number of eggs that will hatch—for mishaps will often occur that spoil your hatch even when almost ready to come off.

When you buy Baby Chicks, you select your breed, order the number you can care for, heat your Brooder, and you are right in the chicken business with both feet. Of course, it goes without saying that your Brooder must be constructed along correct lines—for upon the evenness of your Brooder's heat greatly depends the result. Brooders poorly made where the chicks have a tendency to "pile up" in order to keep near the proper temperature, cannot raise a full percentage of chicks, no matter how carefully hatched or how strong they may be. If your Brooder is right, you should raise 95 per cent of all chicks you start with.

We guarantee every chick we sell to be a thoroughbred, to be healthy, from a well-established strain, and we do not allow a cripple to go out.

We make a specialty of shipments to distant points. They can be sent safely up to 1000 miles and rarely do any die on the journey.

Our prices are $15.00 per 100 on all standard breeds, except White Leghorns, which are $10.00 per 100. We can sell in smaller numbers if you wish.

One order placed with us will prove to you that we "deliver the goods."

We sell Incubators, Brooders, Choice Seed and Poultry Supplies.

F. Gilman Taylor Seed Co.
803 South Main Street Los Angeles, Califoania

Trap-Nested White Wyandottes

That won 22 ribbons out of 25 and 6 Silver Cups and a carving set and a cut glass vase. All the National White Wyandotte Club Ribbons. Second on 10 pullet pen contest open to all breeds. Mammoth Bronze Turkeys, winners of 5 blue ribons, all at Los Angeles County Poultry Ass'n Show, Dec. 7, 1907. White Wyandottes were judged by H. Berrar of San Jose, Cal., and W. W. Browning of Ogden, Utah.

Mission View Poultry Ranch Mrs. C. D. Hubbard **San Fernando, Cal.**

A GREAT RECORD.

I note your request for report of egg records, and I take pleasure in inclosing you herewith a true record of a breeding pen of one drake and five ducks of the Mammoth Pekin variety.

One of these ducks on the 21st of December, 1907, laid three eggs, and by referring to the record you will notice that she has repeatedly laid two eggs in one day, the extra eggs being, however, soft-shelled.

By averaging the shortage, I find that the first duck to lay has up to date, when she is about 9½ months old, laid 135 eggs, and the rest are all following her at the same rate. The five ducks are all we have on the ranch, and we can make affidavit to the correctness of this record.

If any one can beat this record, I will be pleased to learn their address, as I will pay a good round price for a drake of the right kind.

I have young ducks hatched from this pen that weigh three pounds each at six weeks old.

We have no eggs or stock for sale at this time, as I am hatching every hatchable egg, and when we are ready to do business, will give due notice through the advertising columns of the Cultivator.—A. B. Shaub, Bell.

Mr. Shaw gives an itemized account of the production day by day from September 30 to February 18, when the letter was sent. The total monthly record was: September, 1; October, 65; November, 86; December, 104; January, 153; February (17 days) 83, or a total of 492 eggs. Three of the ducks were hatched May 1, and two of them July 1.

PRACTICAL POULTRY FEEDING.

There is hardly a question that comes to the attention of the poultry man at this season that is of greater importance than feeding. However, we will not attempt this month to present a lengthy article on any one particular branch of feeding, nor set down hard and fast rules for feeding the fowls, but simply mention a few items touching various lines of the subject.

Wheat and oats are the best grains for producing bone and muscle and vigorous growth. To these add corn to the evening meal as the weather gets colder.

While wet, sloppy food may not sour at this season, it is not a good condition in which to give food to the fowls. If mash must be fed, feed it in a crumbly state, or better still, perfectly dry, from self-feeding hoppers or protected feed troughs.

Separate the grown and growing stock and fed them according to their condition and needs. Old stock will get too fat on a ration that is absolutely necessary for the proper development of growing fowls. Feed separately and there will be much less trouble with over-fatness in grown stock and improper development in growing stock.

Feed regularly as there is nothing that makes the fowls discontented, and hence unprofitable, more quickly and certainly than dilatory methods in feeding.

Fresh green cut bone is one of the very best and cheapest substitutes for the natural animal food the fowls get on the range. The health and vigor of the flock can be materially improved and the profits increased by judiciously feeding green cut bone.

In feeding green cut bone do not go on the theory that if "a little good more is better," as it is v rich and overfeeding of it has a t dency to bowel trouble. Use care a common sense; start with feedin small amount and increase grad as the fowls become accustomed t About one-fourth of an ounce bird per day for pullets or o stock is sufficient to commence w and this may be increased to a ounce each day per bird.

Condiments, such as red pe mustard, etc., should be fed great moderation, if at all. stimulate for a time, act on the gestive and egg organs as a wh a horse, but in time unfit the f for breeding or layers.

Wheat bran should be kept wi reach of fowls at all times. F it in hoppers or shallow boxes, troughs; if the latter, tack l across the top of the box or tro a short distance apart so that t fowls can get at the bran but scratch it out and waste it. Br aids in keeping the digestive org in healthy condition and also acts a stimulant on the egg producing o gans. The fowls will consume la quantities of it, and there is li danger of their eating too much.

Milk, either sweet or sour, is ex lent for fowls and especially at th time when the pullets are near the laying period and animal food o the range is scarce, if the fowls have been fortunate enough to have range It may be fed clear in troughs or in vessels provided for the purpose, or it may be used to moisten the mash. It makes the mash more palatable and the fowls eat it much more readily. However, it increases the danger of overfeeding, as poultry, like some people, eat because food tastes good and do not stop with only what nature demands.

It takes practically the same amount of feed to mature "any old kind of a chicken" as it does to mature a pure bred one worth many times its value. It is, therefore, economy to put the feed into pure bred stock.

Do not feed musty grains and then wonder why the poultry is not thrifty. Musty grain cannot produce healthy meat.

Lay in a supply of green food if it has not already been done. Cabbage, beet, carrots, turnips and onions are all good and the small unsalable ones will answer if others are not ob tainable, or for various reasons i is not economy to feed them. Be in mind in this connection that i winter feeding for good results gree food is very necessary. If summer results are to be expected summer conditions must be provided in so fa as possible.

Feed as great a variety as is pos ble as this has much to do with the health of the fowls. Fowls are often unthrifty simply for lack of variety. They tire of a sameness the same as human beings.

The commerical oyster and clam shell which is often sold on the ma ket as grit are good for shell-forming material, and in a measure acts as grit, but they do not take the place of the hard, sharp grits that are manufactured for the purpose. Sharp grit is as essential as wholesome food. Lack of grit often causes digestive disorders.

Don't form the impression that corn is not good for fowls. It is a good egg producer and during the winter a full feed can safely be fed each evening.

FECTED POULTRY OF AMERICA.

book which will be of great to poultry fanciers, has just issued from the press of the ard Publishing Co., of Washing- D. C. It is "Perfected Poultry merica," a concise, illustrated ise of the recognized breeds of ry, turkeys and water fowl.

is written by T. F. McGrew and E. Howard, and is illustrated oul P. Graham.

is not exactly a standard but is etailed description with il- ations in detail, which enables novice to form a correct idea of form and feather of any breed. e illustrations are superb. Re- ing them the "Foreword" says: he illustrated portions of this are unusually interesting, and presented with a great deal of faction. The artist has per- ed his work well, and his models been the best to be found. No mpt has been made to idealize specimen, but rather to give vings that would be recognized appreciated for the types of ls to be seen in the average ding yards or show rooms of the try. These drawings probably be criticized in some minor de- s, yet, as a whole, we are satis- they will be regarded as typical imens of the American breeder's cy, and will be given credit as being a truthful portrayal of breed types. As a reference book, it should prove of untold value to every breeder and fancier, and by following its pages the chances of success in breeding and mating should be enchanced for the expert as well as the novice."

The Cultivator can supply the book to those who wish it. See shop talk on Editorial page.

HOW AND WHAT TO FEED,

For ten hens, one quart of grain is sufficient for a day's ration. Especially for the smaller breeds.

However, Brahmas or Cochins, if they do not have access to green food, will require about one quart to five hens during the laying season.

All fowls relish a cooked breakfast or dinner, potatoes, turnips, carrots, cabbage or anything in the way of scraps from the table. Equal parts of corn and oats ground together, and middlings boiled or steamed, if served while warm, makes a good breakfast for laying hens. Another good food for the morning ration is corn chop, ten pounds; barley chop, ten pounds; middlings, five pounds, and bran, five pounds. Mix all together, then scald with just enough boiling water to make a thick mash; add sufficient water and milk, so that it can be readily eaten by the fowls.

For an evening food we usually give whole grain, either wheat or oats. Corn is not good food in summer, as it does not contain the required ingredients to produce an abundant supply of eggs, and is productive of too much heat. Never feed corn during the laying season, except that part contained in the soft mash, which is given to the fowls in the morning. Another important factor in egg production is green food. In order to have fowls do best, they must be supplied with yards large enough to furnish an abundant supply of grass.

AMERICAN BUFF WYANDOTTE CLUB.

The American Buff Wyandotte Club has a very instructive catalogue on this exceptionally prolific winter egg laying breed, and anyone wishing to become better acquainted with their merits, kindly address O. S. Hofmann (State vice-president) or Henry R. Ingalls (National secretary,) Greenville, N. Y., for one of these catalogues.

BLACK AND WHITE POULTRY YARDS.

Bloem and Vandergoot, proprietors, of the Black and White Yards, are Ed. M. Burnell's successors. This firm recently purchased Mr. Burnell's entire stock of Columbia Wyandottes, including his prize winners, good will and equipment. This gives Messrs. Bloem and Vandergoot the best flock of Columbians on the Coast and we are glad to see the flock in good hands. The ranch is situated about one mile east of Glendora, and is well located for poultry. Any of our readers wishing either stock or eggs will do well to correspond with the above firm.

The infidel argys just az a bull duz chained to a post; he bellows and paws, but he doesn't git loose from the post I notiss.—Billings.

"What! marry my daughter, sir?" cried the rich old man; "why she's my only child." The young man smiled. "Oh, that's all right," he said, undaunted; "you see, sir, one was all I wanted."—"Tit-Bits."

West Coast Cresol Dip

Strongest and most effective Germ Destroyer, Insecticide and disinfectant. Made of Coal Tar Creosote Oil. Great caution must be exercised in using Carbolic Dips and those that contain Petroleum oils. Reports in 1905 from Wyoming show that many sheep died on account of dipping in petroleum. Sulphur-Lime dips impair the quality of wool on sheep, and sometimes blind them. Tobacco dips very often sicken sheep. And none of these dips can compare in effectiveness with Cresol Dips. These, while being most effective, are perfectly harmless. Wool is improved by their use, as it not only cleanses the wool but leaves no stain and gives it a soft texture.

But Cresol Dips differ very much. A Coal Tar Dip depends for its activity almost entirely upon the Cresylic Acid it contains. West Coast Dip is guaranteed to be made from Coal Tar Creosote Oil containing 25 per cent Cresylic Acid. Most dips sold in the United States are made from domestic creosote oils, which run about one-half the strength of imported oil. Permission was given by the U. S. Dept. of Agriculture to use our Dip for the treatment of sheep scab in the proportion of one part Dip to 67 parts water. This is the highest dilution we have ever heard of being permitted by the Department. When thus diluted it costs but a trifle.

For sale by many dealers. If yours does not keep it, send direct to us for trial offer, "special price and freight prepaid."

MILK FEVER.

BY ERROR the article by Mrs. Sherman was left incomplete by the leaving off of the last few paragraphs. In the former article the fear of the disease which formerly existed, a description of the disease, the discovery of remedies and the trials made which have proved the effectiveness of the comparatively recent discovery, were given. The following is the remainder of the article.

Milk Fever Outfit.

This is simple enough; it consists of a silver milking tube to insert into the teat and a rubber tube connected with a hand bulb, the other end of the tube is in a jar covered over the top with cotton batting to strain the air. The quarters are pumped full of air in each quarter and the cow is left in peace. The affect is a little short of a marvel, a cow lying unconscious is treated and in a few short hours she is up and well as ever. No reoccurance need be feared for the owner has become wiser and will not allow the causes that produces the effects. The air pumping outfit should be in every dairyman's hands, as it is a valuable aid in treating inflammed or congested udders. The quarters are pumped full of air and after the milk has been drawn the glands expanded to their fullest are kept soft and open. The air entering often crackles as it penetrates the parts.

Book Dairyman.

The cure for milk fever is one of the triumphs of the scientific farmer. Another was the discovery of the tick as the spreader of Texas fever. The control of Black leg by vacination followed. Now lumpy jaw is coming to have a cure. Tubercolosis is the last and greatest to be dreaded of cattle diseases. It has been given an undue prominence by the effort to scare the lairymen into better ways. The result is that the dairyman is claiming a higher price for his proructs than ever before. This is right—for if he has made mistakes he has had to pay dearly for them. The money he bougth his cows with, was often all he had and it was a sad lose to him when the sows proved to be diseased. He had no way of knowing better. Do you realize how very few years ago a beef carcas was shown at a Massachusetts fair as a curious freak that was merely a case of could tell the name of the trouble. It was called "Pearl Disease."—M. E. Sherman.

MILKING MACHINES.

In a report issued by the Connecticut Experiment Station we note the following in regard to effect on quality of milk when the milking machine is used:

In nine experiments the milking machine was treated in different ways and the bacterial content of the machine-drawn milk was compared with that of hand-drawn milk.

In the first experiment the machine was at night simply rinsed by pumping warm water through it and after use in the morning taken apart, scrubbed with hot water and washing powder, and rinsed with clean water. The pails were sterilized by steam. The bacterial content of the machine-drawn milk averaged 15,524 per cubic centimeter and of the hand-drawn milk 3144.

The machine was next treate in the first experiment, but in tion the rubber tubes and teat were kept from morning until ing in a 1:300 solution of a w powder. The bacterial conten the machine-drawn milk aver 43,122 per cubic centimeter and the hand-drawn milk 18,729.

In the third experiment the and cups were kept in a 2.5 per solution of formalin between ings, other conditions being same as in the previous experime The tubes were made practic sterile by this treatment and rubber was not injured. The covered teat cups, however, somewhat corroded. The aver bacterial content of machine-dr and hand-drawn milk was re tively 20,225 and 23,329 bacteria cubic centimeter.

In the fourth experiment all p of the machine were sterilized steam. This was found very i rious to the rubber. The ave bacterial content of the mach drawn and hand-drawn milk respectively 19,984 and 18,172 teria per cubic centimeter.

In the fifth and following exp ments a new style of connector used, which admitted air into teat cups to relieve suction. T tubes and cups were kept in a 10 cent salt solution between milkin This treatment did not render t tubes sterile, and the brine its was found to increase in germ co tent from day to day. The machin drawn milk contained on an av age 12,962 bacteria per cubic cen meter and the hand-drawn milk 1 306.

The tubes and cups were next ke in a borax solution made by dissol ing one pound of borax in 15 quart of water. This did not sterilize appartaus. The machine-drawn milk contained 17,817 bacteria pe cubic centimeter and the hand drawn milk 8767.

In the seventh experiment th authors returned to the form treatment, using 3.5 per cent, still the machine-drawn milk con tained more bacteria than the han drawn milk, the averages being spectively, 7857 and 6355 bacteria cubic centimeter.

The formalin treatment was tinued in the next experiment, the air taken into the teat cups w filtered through absorbent cott This reduced the bacteria in the chine-drawn milk to 1578 per c centimeter, while the average n ber in the hand-drawn milk w 4560. In a second series in whi the cotton filters were omitt the average bacterial content of the cine-drawn milk was 11,521, and the hand-drawn milk 7467.

In the final experiment lime w was used in the place of the forma solution. The bacterial content the machine-drawn milk was 55, 67 and of the hand-drawn milk 5908.

The formalin treatment was, therefore, the only one tried which was efficient in sterilizing the apparatus and at the same time was not injurious to the rubber.

In most cases the machine-drawn milk, notwithstanding the bacterial content, was frequently higher, kept sweet longer than the milk drawn by hand..

JUST GETS IT FROM THE COW.

Our milkman is a wonder;
  Though strange the fact may seem,
The fluid that he sells is pure
  And yields up real cream,
You wonder how he does it,
  And I will tell you how:
He has no "laboratory." He
  Just gets it from the cow.

When you put out your ticket
  You're not afraid you'll get
A lot of chalk and water that
  Will fill you with regret;
  No! You are sure of richness,
  Because I tell you now
He has no "laboratory." He
Just gets it from the cow.

I don't know why he does it;
  It seems a foolish thing
To be so honest nowadays,
  When boodle reigns as king;
Yet he goes on his journey
  With calm, unclouded brow;
He has no "laboratory." He
  Just gets it from the cow.

TREATMENT AFTER ABORTION.

A subscriber writes to ask what treatment should be given a cow after abortion.

Dr. R. A. Craig pronounces this a germ disease which should be treated progressively until the disease is mastered. The stall where the cow stands should be disinfected with a spray of tar disinfectant, or five per cent carbolic acid compound. The manger should be sprayed and the stall afterward treated to a coat of whitewash. The cow should be removed from the herd and treated for three weeks, at least.

Dr. Craig then prescribes this treatment in the Jersey Bulletin:

"After the cow aborts, the womb and maternal passages leading to it should be irrigated daily with a one per cent water. solution of a tar disinfectant for at least two weeks. After the discharge from the vulva disappears and the parts appear normal, the cow may be bred. This usually takes from two to three months.

"The bull should be treated before and after each service. The long hair in the region of the opening into the sheath should be cut away, that the part may be easily cleaned. The treatment consists in washing the hair in the region with a disinfectant, and cleansing the sheath by injecting the disinfectant into it with a syringe."

LOCO.

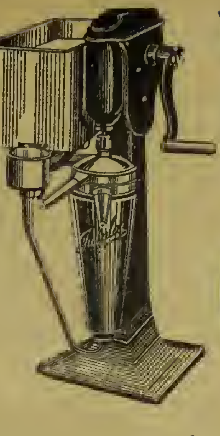
Regarding ridding pastures of "Loco" weed, we note the following in a bulletin of the Montana Experiment Station:

During the season of 1901 Dr. Tudor lost about 300 out of a herd of 2000 lambs. Acting upon the advice from this station the next spring, 1902, he employed two men for about a month in May and June to dig up the loco plants on an area of about four miles square. The plants were cut off just below the crown, the point where the leaves arise from the root, two or three inches below the surface, a narrow, heavy hoe being used, and when this was properly done the plants never started again nor have new plants come up the present season, 1903.

It is hardly possible to completely exterminate the plants in one year's digging, as some plants will be unavoidably missed while others may spring from seed previously scattered, so that several diggings may be necessary. Loco should always be dug during May and June when in blossom.

Imperial valley was visited by 200 of Los Angeles' foremost business men last week.

The Tubular Separator **Will Give Service for a Lifetime**



We gave a Tubular the equivalent of a Fifty-years Run and it showed no wear and was good for fifty years more.

We've proved the Tubular, and recommend it to dairymen on test.

We furnish an unlimited guarantee, because we know how the Tubular's built and that it will give long service.

Here's our Guarantee:

Guaranteed Forever

We guarantee Tubular Separator No............... against defects in either material or workmanship, and agree to replace, **free of charge**, any part or parts of same which may have become unfit for service because of original defects, **providing the damaged parts are returned to our factory.** The term of this guarantee is unlimited and our agreement will be fulfilled any time. Repairs necessitated by ordinary wear and tear, accidents, abuse, etc., are not included in this warranty.

The Sharples Separator Co.
West Chester, Pa.

Here's the Tubular Test:

Machine	No. 9 Tubular
Rated capacity per hour	900 pounds
Hours in operation	2,600
Pounds separated	2,340,000
Revolutions of crank	6,837,480
Revolutions of bowl	2,496,000,000
Oil used	6½ quarts
Time oiling	About 8 minutes
Time adjusting	10 minutes
Repairs	75 cents

At the end of the twenty-fourth week we made a very careful examination of this Tubular. We found that two of the nine balls in the frictionless bearing supporting the bowl were beginning to wear unevenly. To preserve perfect balance we replaced the nine old balls in this bearing with nine new ones. After making this small repair the machine ran 28 weeks longer and finished a full year without needing further repairs or adjustment. The exchange of balls costing only 75 cents and ten minutes work, yet made the machine as good as new.

Did you ever hear of any other sort of a separator giving a test or a guarantee like these? Good for a lifetime?

Don't you think both are conditions of value to dairymen, and of pride for the Tubular manufacturers?

Wouldn't other separators gladly furnish like evidence and assurance if they could? And isn't it because of inability to meet such standards that they don't offer equal proofs and guarantees?

No bowl except a suspended bowl could meet such conditions as the Tubular can. But there isn't any other suspended bowl in the whole country—all the others are supported. There's the difference—and a lifetime of service is a part of Tubular accomplishment.

Never an explosion with a Tubular—only "barrel" and "bucket bowls" do that. No oil waste with a Tubular; no drip, no dirt, no lost oiler, no oil-holes nor cups to clean out, yet the perfect lubrication which is a condition of long time, easy running.

Write for Catalogue No. 260. Let us tell you about cream separating and what the Tubular can earn—save—for you in your home dairy. No cost to you to get information—and if you have a good herd and no Tubular we can tell you how to get more profit from your cows than you get now.

continue to keep the
U.S. CREAM Separator
at the Head of the Procession

Remember: The separator which gets just a little more cream from the milk each day soon pays for the difference between the best and the "cheaper" article.

Remember: The separator which lasts practically a lifetime, doing good work every day, is a better investment than the cheap machine constantly needing repairs and worn out in a few years.

TWO MILLION SHEEP TO BE DIPPED.

With a view to staming out sheep scabies, Charles Keane, State Veterinarian, with seventy-five assistants, will, under a proclamation that will be shortly issued by Gov. Gillett, require every sheep in the State to be dipped two times between March 1 and June 1 next.

It is estimated that there are 2,000,000 sheep in Caliornia, and to do the work thoroughly, the State Veterinarian will call upon the County Boards of Supervisors for co-operation, and has already been assured assistance from the Bureau of Animal Industry of the United States Agricultural Department at Washington.

Between thirty and forty men will be furnished by the department for the work.

KANSAS—HOG PARADISE.

The following by F. D. Coburn, secretary of the Kansas Department of Agriculture, may be true of Kansas now, but wait till California fully appreciates the hog and its possibilities of producing it, and perhaps the market may demand "California" on the rind.

It was well said by a former cabinet minister that in the American hog we have an automatic, combined machine for reducing bulk in corn and enhancing its value. That he is a mint, and the corn of our common country the bullion he transfers into golden coin.

In Kansas he finds the favored zone—his El Dorado—and here he always makes both ends meat, for Kansas is a corn orchard parked with grasses and fragrant with the bloom of alfalfa, the greatest forage plant vouchsafed by Providence to men; growing here in a profusion elsewhere unknown. Hence it is that Kansas possesses more of these latest model, self-lubricating mortgage-removers than all New England and fifteen other States and Territories added.

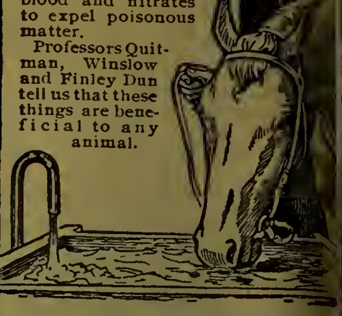
Uncle Sam, our foremost connoisseur of pork, but with no especial partiality for Kansas, recorded in a report for January of this year 1907, that the Kansas hogs are worth "Per Capiter" 15 per cent more than the Missouri hog; 36 per cent more than the Kentucky hog; 56 per cent more than his Virginia compatriot; 97 per cent more than the Arkansas hog, and 148 per cent more than Florida's favorites.

There is probably no other territory of the same area as Kansas where the conditions of climate, soil, food and care are more congenial to the hog's health and wholesome development, and he is nowhere found so developed except among and by a high order of people. High-class swine are unknown and impossible among a low-class people.

Kansas swine, coinage of Kansas grass, grain and brain, in the world-arena at Chicago and then at St. Louis met the world-beaters and beat them. She has given Poland, China, Chester county, Berkshire and New Jersey a thousand years the lead and easily distanced the namesakes of all.

The Kansas hog, in his sphere typifying the good, the true and the beautiful, is a joy even to the Hebrew, and like the State that lends him as a solace to humanity, is in but the morning of his career. His one passport, everywhere demanded and always sufficient for entree to presidents, potentates or peasants is "Kansas" on the rind.

PILES CURED IN 6 TO 14 DAYS
PAZO OINTMENT is guaranteed to cure any case of Itching, Blind, Bleeding or Protruding Piles in 6 to 14 days or money refunded 50c



Horse Sens
Proper management of farm te
requires good sense on the part of
owner. An ignorant farm hand ea
ruins the best horse by unwise feed
and mismanagement. Best results
obtained by keeping the system of
horse healthy and active, especially
the digestive organs. Owners who make daily use of Dr. Hess Stock Food have serviceable, active and handsome horses. It is a tonic which acts directly upon the digestion, contains iron for the blood and nitrates to expel poisonous matter.
Professors Quitman, Winslow and Finley Dun tell us that these things are beneficial to any animal.

FARM LANDS FOR SALE.

THERE ARE TWO CONDITIONS TO CONsider in buying land—the Fertility of the Soil and the Irrigation facilites. It must have an unfailing water supply, otherwise the Land is worthless. Not from some ditch that brings the Water from miles away, and that climbs up and down hill, and sometimes brings you Water when there is an overflow. What you must have is an inexhaustible stream or River that cannot and never has dried up. That is what has caused such a demand for Empire Ranch Land. The Kings River flows through it for 9 miles and it is one of the largest and most dependable Irrigation streams in the United States. An inexhaustible Water Supply.

THERE IS LOTS OF LAND, but not of the Empire Ranch kind. That is becoming scarcer every day. This is some of that Rich California Sediment Soil Land immediately adjacent to that Fertile strip of which Hanford (noted for its Butter), Fresno (noted for its Raisins,) and Lemoore is a part. Better arrange to Join Our Party for a trip to Empire Ranch. We have Special Excursion Rates—you pay your fare and we will pay all your expenses for two days. EMPIRE INVESTMENT CO., Phone B'dway 5074, 415 H W. Hellman Bldg., 4th and Spring, Los Angeles, California.

FOR SALE—1 to 10-acre tracts on car line between Riverside and new cement works. Good for chicken ranches, alfalfa or gardening. Will sell on easy terms. Plenty of water on each tract. C. C. POND & N. R. BELL. Riverside, Cal.

FOR SALE FOR $1750—AN UP-TO-DATE chicken ranch. Five hundred Rhode Island Reds. Well advertised. Good paying business in best inland town in State. If interested address "THE RED" care of Cultivator, 115 N. Broadway, Los Angeles, Cal.

FOR SALE—40 ACRES, LEVEL; FINE for chickens, vegetables, berries, etc., $30 per acre; a bargain. WM. MANTZ, Santa Maria, Cal.

MISCELLANEOUS.

DELMONICO'S CHEF SAYS: "THE ANchor egg separator works perfectly; no well regulated hotel or household can afford to be without it." Send ten cents, or ten names of persons keeping poultry, and we will send one postpaid. WEST COAST MILL, 818 San Fernando St., Los Angeles, Cal.

FOR SALE—TWO HUNDRED THOUSAND Palmetto asparagus plants. Also four varieties of almond trees. Extra fine stock of plums, peaches, pomegranates, etc. IMPERIAL VALLEY NURSERY, Imperial, Cal.

FOR SALE—HAVE ABOUT 800 SACKS IMproved Minnesota Burbank seed potatoes, $1.50 per hundred, F. O. B., Garden Grove, on the Pacific Electric. J. W. WALLS, Garden Grove, Orange Co., Cal.

DEVICE FOR HOLDING COW'S TAIL while milking. Sent postage paid 10c. BOX 17, Arbuckle, Cal.

MELON SEED.

NO BETTER SEED GROWN THAN I OFfer you. Chilian watermelon seed white or red, 60c per pound; pineapple cantaloupe seed, 80c per pound by express. Mail fifteen cents extra; supply limited. S. FAIRBURN, Burbank, Cal.

ARTICHOKES.

FOR SALE—JERUSALUM ARTICHOKES—The great winter hog feed. Address FANCHER CREEK NURSERIES, Fresno, California.

ROSES.

FOR SALE—ROSES, FIELD GROWN AND grafted; two-year-old plants. Will sell in large lots at a bargain before potting them. H. L. BAUER & SONS, 737 S. Spring St., Los Angeles, Cal.

FOR PROTECTION OF LOWLANDS.

In order to make initial work effective according to the plans and suggestions of the Board of Engineers, known as the Dabney Commission, employed by the State to investigate and report upon the betterment of conditions on the rivers, there is now before the Congress of the United States H. R. Bill 3892, introduced by Congressman McKinlay, which has for its object the appropriation by the United States of $400,000 to be used in conjunction with a similar sum to be appropriated by the State of California to do such dredging, embanking and other necessary work to control the waters and protect the lands along the Sacramento and San Joaquin rivers.

The River Improvement and Drainage Association of California has been working to bring about the passage of this bill, and has enlisted the good offices of numerous people in all parts of the United States to bring pressure to bear on Senators and Congressmen from all parts of the Union to have them vote for the bill.

The association is anxious that every Californian who has the interests of the State at heart will join in this movement to the extent of writing or wiring to his Congressman and to the Senators at Washington, urging upon them the necessity for supporting H. R. Bill 3892.

The fruit crop of Washington in 1907 brought that State $10,000,000.

Great Bargain in Fine Land

The Big Field Ranch in Kern County is being colonized and is now on sale at the low price of $25 per acre, 1-4 cash.

It lies in the heart of activity in the San Joaquin Valley, a broad area of perfectly level land, consisting of rich sediment.

This land has an inexhaustible supply of artesian water, and is fully equal in productiveness to any land in California, regardless of price.

Suitable for grapes, alfalfa, peaches, grain, sugar beets, dairying, etc.

Unquestionably the greatest snap in high class land ever offered in the State. Excursions leave Los Angeles every few days. Call or write for maps, booklets and full information. Do not delay. Do not locate anywhere without seeing this magnificent property.

7000 acres have been sold to practical farmers. 5000 acres will be under cultivation this season.

Household Departmen

THE SECOND TABLE.

Some boys are mad when com'ny comes to stay for meals. They hate
To have the other people eat while boys must wait and wait.
But I've about made up my mind I'm different from the rest,
For, as for me, I b'lieve I like the second table best.

To eat along with com'ny is so trying, for it's tough
To sit and watch the victuals when you dassant touch the stuff;
You see your father serving out the dark meat and the light
Until a boy is sure he'll starve before he gets a bite.

And when he asks you what you'll have,—you've heard it all before—
You know you'll get just what you get and won't get nothing more;
For when you want another piece your mother winks her eye,
And so you say, "I've plenty, thanks," and tell a whopping lie.

When com'ny is a watching you, you've got to be polite,
And eat your victuals with a fork and take a little bite.
You can't have nothing till you're asked and, 'cause a boy is small
Folks think he isn't hungry, and he's never asked at all.

Since I can first remember I've been told that when the cake
Is passed around, the proper thing is for a boy to take
The piece that's nearest to him, and so all I ever got,
When com'ny's been to our house, was the smallest in the lot.

It worries boys like everything to have the com'ny stay
A-setting round the table like they couldn't get away.
But when they've gone and left the whole big shotting match to me,
Say! ain't it fun to just wade in and help myself? Oh gee!

With no one round to notice what your doing—bet your life—
Boys don't use forks to eat when they'd rather use a knife,
Nor take such little bites as when eating with the rest,
And so, for lots of things, I like the second table best.

—Nixon Waterman.

THE CONDUCTOR.

THE young man on the back platform pulled the bell. The car started with a jerk. The girl caught at the door casing and the young man lightly touched her arm. She looked at him with a frown.

"You!" she cried.

He smiled. He had a very pleasant smile.

"Nobody else," he answered. "You'll find a seat forward, lady."

"What are you doing here?"

"Collecting fares."

She frowned again.

"Will you ever be in earnest."

"Fare, please."

She silently handed him a ticket.

"Transfer?"

"No."

She was quite angry. She would not look at him again, but passed into the car and up the aisle.

Nearly all of the passengers were men. There would have been room for her if they had moved closer together. They left her standing.

She reached up and clutched a strap.

Presently the young conductor came up the aisle.

"A little closer, please," he said, "and make room for the lady."

One of the men grumbled something about overcrowding, but he moved a little, and two more men moved a little, and lo! there was plenty of room.

The young woman sat down, she did not thank the conductor

"Did I get your fare?" he a her in an official tone.

"Yes," she answered.

"Transfer?"

"No."

He walked away smiling watched him and frowned How could he be so indiffer careless? She had no patienc him.

He had everything in his f very rich father, a fine ed the advantages of travel. Y steadfastly refused to make a fied use of these benefits. H popular personally, quite too po He might have gone into politi was just the man the poli wanted. But no, he resiste their attempts to draw him fro indolent ways.

She liked him, everybody him, but she couldn't forgi lack of all ambition.

He liked her. He had told but she resolutely kept him a tance. If he wanted her he prove himself worthy of her.

And here he was masqueradi a conductor. How could he t position that poorer men n How could he be so indifferent public opinion, to her opinion.

AD CYCLE CO., Dept. L-258 Chicago, Ill.

An average girl is never satisfied til she acquires a son-in-law for r mother.

the little one. She was joined by the young conductor, who ran forward and knelt beside her. People were running toward them, screaming, gesticulating. A long-bearded man rushed up and struck fiercely at the motorman. A stone was thrown. She heard the crash of glass.

More people were running. The screaming and shouting seemed continuous. Twenty clutching hands tried to reach the motorman. Fifty voices hurled maledictions at him. He drew back against the vestibule.

The young conductor was standing up now. He had the child in his arms. He was talking to them. She saw his lips move. The people near him were listening, but those in the rear were wailing and shouting.

He pushed a little forward to where the motorman was crouching.

A man crept to one side and fiercely struck the motorman across the head with a heavy stick. The motorman slipped and fell at the conductor's feet.

"Lynch him! Lynch him! "the girl heard some one shout.

The conductor was very white as he faced them with the child in his arms, but his mouth was firmly set and there was a new light in his gray eyes.

Suddenly he put the little one in the nearest woman's arms and thrust back the shrieking mob that was struggling fiercely to reach the unconscious motorman. He caught the stick from the man who had dealt the blow and menaced the mob with it. A stone knocked off his cap and cut his white forehead. The girl saw the red stain and screamed and ran from the car.

There was no mob about the back platform. She leaped to the pavement and ran swiftly down the street. She remembered where the police station was. She had been there with a sorrowing mother whose only son was in trouble.

As she turned the corner she saw an officer in front of the station. She waved her hand at him.

"A mob," she screamed. "A mob is killing a man!"

He turned quickly and called something through the open doorway. Then he ran past her, another officer following close behind him.

Would they get there in time?

Presently she pulled herself together and turned back. When she reached the corner she saw that the police had forced the mob away from the car and were clearing the sidewalks.

Her strength came back to her and she ran forward.

The officer she had hailed was on the platform.

"It's all right, miss," he called to her, "but you didn't get us here any too soon."

He helped her aboard the car.

She gave a quick glance into the interior. She saw that the motorman was in the vestibule, an officer at his side. She saw the young conductor. He was propped up in the corner seat, his coat torn, his face grimy and stained. He looked up at her with a faint smile.

"He'll be all right presently, miss," said the officer. "He was putting up a wonderful fight when we got here. He saved the motorman all right—and you saved him. And the child isn't much hurt, either, miss."

The girl hesitated a moment.

"He's a little dazed, miss, but you needn't be afraid of him."

Afraid of him! She dropped into the seat at his side and gently drew the wounded head against her breast.

"Do you know him, miss?"

There was pride and infinite tenderness in her tone.

"I am to be his wife," she simply said.—W. R. Rose, in the Cleveland Plain Dealer.

RECIPES.

Crumbed salmon is a good luncheon dish. To make it use a pint of thin white sauce, seasoned highly with lemon juice and Worcestershire sauce. Add a can of salmon which has been broken into flakes with a fork. Fill ramekins with this mixture and cover the top with buttered crumbs and a spoonful of cream. Bake quickly in a hot oven.

Perfection Sweet Potatoes.

Remove skin and cut in half lengthwise medium-sized sweet potatoes, place a layer in a buttered dish, sprinkle lightly with salt, powdered sugar and tiny pieces of butter, then another layer and seasoning, until the dish is full. Season the top layer a little more freely, and bake half an hour. Increase heat and brown the top.

Pressed Chicken.

Chop fine any cold boiled chicken left over, season well with salt, pepper and butter and moisten with a little of the liquor in which it was cooked, or the gravy, add one cup dry bread or cracker crumbs, heat thro thoroly, put into a deep dish or basin with a plate on top and weight down until cold. Serve cut in squares on a platter garnished with water cress, parsley or lettuce. Nice for picnic lunches.—Hetty Hicks.

Chocolate Pudding.

Quarter of a pound of sugar, quarter of a pound of butter, quarter of a pound of chocolate, quarter of a pound of almonds, four eggs.

Rub the butter and sugar to a cream; add the yolks of the eggs and grated chocolate, the almonds, chopped fine, and, lastly, the whites of the eggs, well beaten; bake for one hour in a moderate oven.

Serve as soon as possible after taking from the oven. To be eaten with one pint of boiled custard.

Lenten Cooking.

The housewife who is eliminating meat from her menus these Lenten days must see to it that the drop in food values is not too great. Cheese is a good meat substitute, preventing the "gone feeling" that so many complain of when suddenly deprived of the meat diet to which they have been accustomed. Other nutritious foods are dried peas, beans and lentils, graham, cornmeal and whole wheat breads, with plenty of butter, cream and eggs. Scallops and fish or vegetables, served with forcemeat, make substantial main dishes for a meal, as also creamed salt codfish, the various forms of macaroni and spaghetti with tomato or cheese. In the transition from meat soups to the various vegetable creams or purees, cream may be used in place of milk with excellent results, while a carefully combined and seasoned vegetable soup will prove vastly more appetizing and nourishing than an indifferent meat soup.

SAID TOO MUCH.

First Tramp—After all it pays to be polite, pardiner.

Second Tramp—Not always. The other day I was actin' deaf and dumb when a man gave me sixpence. I says "Thank you, sir," and he had me arrested.—Tit-Bits.

Citrus Market

LOS ANGELES, Cal., Mar. 18, 1908.

The orange market is in very good condition and the market seems to receive willingly the vast quantity of fruit now going forward. As high as 250 carloads have been forwarded in a day, though, as a rule, present shipments aggregate about 200 cars. It is thought that for sometime now the output will not run over 200 and from that down to 175. But as noted above, the Eastern market seems to be taking this vast quantity, and the price is being held very satisfactory to the shipper, thought it is, of course, not up to last year's returns. All there are of navels, Valencias lemons, probably 18,000 cars yet forward, but as the Valencias lemons are a strong factor, thought that the navels will be sorbed by the Eastern market at fair prices.

Owing to the vast quantity of to go forward and to the mo prices that have and will prevail, is a strong hope that the railroa panies will consent to a slight tion in the rate. As it now is th road company is receiving mo the orange grower.

The auctions quoted below fair indication of the ruling though, of course, prices in oth kets usually prevail slightly than the auction.

Lemons.

Lemons are still in the dump vast quantities of foreigns b thrown on the market. These i tations are slowing up and the is felt that the market will soon

Shipments.

Total shipments of citrus fru date aggregate 12,446 cars, of 1663 are lemons. Last season date 10,241 cars, of which 1116 lemons.

NEW YORK, March 17.—Ni navels, four lemons and one bloo Navels firm and 5 cents higher o fruit. Lemons in good demand strictly fancy. Ordinary stock dull. Weather cloudy and cool.

BE UP-TO-DATE.

Charles Arthur Carlisle, of the Studebaker Bros. Mfg. Co. of South Bend, Indiana, made a vigorous appeal to the farmers of the St. Joseph valley, in Northern Indiana, on Tuesday, February 4th. Mr. Carlisle divided his address into several questions, embracing the following:

First. Does it pay the farmer to keep blooded stock? Under this head an effort was made to cover the entire field of cattle, including the beef and dairy type; also sheep, hogs, poultry, etc. The intrinsic as well as the artistic value of high bred stock and the practical influence in developing the highest efficiency of the animal was clearly brought out in the effort to interest the farmer in systemmatically undertaking to bring up to the highest possible standard all that he undertakes to develop. Records of recent sales of cattle, sheep and hogs, such as that at Disko, Ind., on last New Year's day, when 115 head of Poland China pigs sold for $29,222.50, an average of $254.10; and recent sales of Berkshires, Chester Whites, Duroc Jerseys and other pure breeds of pigs; the records of sales of fat stock at the recent Live Stock Show in Chicago, the fine sales of pure bred Guernsey's at Madison, N. J., and of registered Jerseys at Lowell, Mass., and elsewhere, all of equal interest, were presented in evidence of what others are doing and what others can do. Mr. Carlisle maintains that pure bred stock has a wonderful stimulating influence in developing a keener interest for the boy and the man on the farm, and develops better care, more careful handling, judicious mating and results in greater profits, pleasure and pride.

Second. Does it pay the farmer to study modern farm science? Under this head, the selecting of seed, planting, cultivating and harvesting of crops; the care of the soil and the feeding of stock on a balanced ration; care of buildings and sanitary methods, were part of the arguments covered in arriving at the conclusion that it "assuredly does pay the farmer to study and apply modern farm science." Mr. Carlisle placed before his large and interested audience the opinions of President Roosevelt, Secretary Wilson of the Department of Agriculture, and the editorial and personal views of a majority of the most able and advanced writers of the day. In concluding the subject, Mr. Carlisle made a strong appeal to each person to subscribe at once for one or more of the leading agricultural papers, first as an evidence of good will and a desire to co-operate in the excellent educational work that such publications are doing, and second with a keen desire to learn. Learn personally what others are doing, then upon the basis of practical knowledge and observation make individual improvements as they suggest themselves. The short course and the high class work of the agricultural colleges, such as Purdue at LaFayette, Indiana and the State colleges of Iowa, Wisconsin, Nebraska, Illinois, Michigan and Ohio was emphasized.

Third. Does it pay the farmer to unite the force of his influence with that of his neighbor in the country and in the town? This subject was divided into several parts. In the first, the speaker developed the force of co-operation, social intercourse, improvement in community interest, and benefits of good literature. He then took up the question of modernizing the curriculum of the district, the ward and the town school, so as to include modern farm science, and made an urgent appeal for teachers who had a training in this direction. In concluding, Mr. Carlisle often quoted from the address of President Roosevelt, at Lansing, Michigan, on May 31, 1907, bringing before his audience the President's thoughts upon these great questions and upon the greatest development of American manhood and American womanhood. Mr. Carlisle is an enthusiast in the development of country pure bred stock, scientific as well as sanitary methods, and devotes his leisure time to this work upon his country place near the city, but above all he takes a keen delight and great interest in every effort to improve the opportunity of the American boy and girl both in country and town.

WORKS UP BRUSH.

The great fuel waste of orchard, vineyard and eucalyptus trimmings has been noted by many and the wish expressed that they might have some machine for working up such stuff. We are informed that this very useful machine has been invented by Mr. Geo. B. Southard.

It is a mechanical device for bringing these limbs and twigs into such compressed form as to make commercial fuel.

Mr. Southard claims that the expense of this manufacture is so slight as to make the machine a success.

Water Pipe Cheap

25 CAR LOADS NOW BEING UNLOADED

250,000 feet of this shipment is second-hand pipe, practically as good as new, and is now on sale at a big discount by the Adams Pipe Works, 2025 Bay street. Sizes and prices: ¼ inch 1½ cents per foot; 3-8 inch, 2 cents per foot; ½ inch, 2½ cents per foot; ¾ inch 3½ cents per foot; 1 inch, 4¾ cents per foot; 1¼ inch, 6 cents per foot; 1½ inch, 7 cents per foot; 2 inch, 9¾ cents per foot; 2½ inch, 15 cents per foot; 3 inch, 18 cents per foot; 3½ inch, 20 cents per foot; 4 inch, 32 cents per foot.

Oil well casing prices and sizes: 2 inch, 7 cents per foot; 2½ inch, 9 cents per foot; 3 inch, 13½ cents per foot; 3¼ inch, 15 cents per foot; 3½ inch, 17 cents per foot; 4 inch, 18 cents per foot. All pipe is carefully inspected, new coupling and new thread are put on every piece, every joint is guaranteed to be first-class, serviceable pipe. This pipe is sold in any amount; small orders are given the same attention as large ones. Mail orders promptly filled. To reach the Adams Pipe Works, take car marked Pacific Boulevard, starting east on 7th St. from Broadway. All lines will transfer to East 7th St. new line. Ask conductor to let you off at Bay St., and go east half-block. Phones, A1917, Broadway 1263.

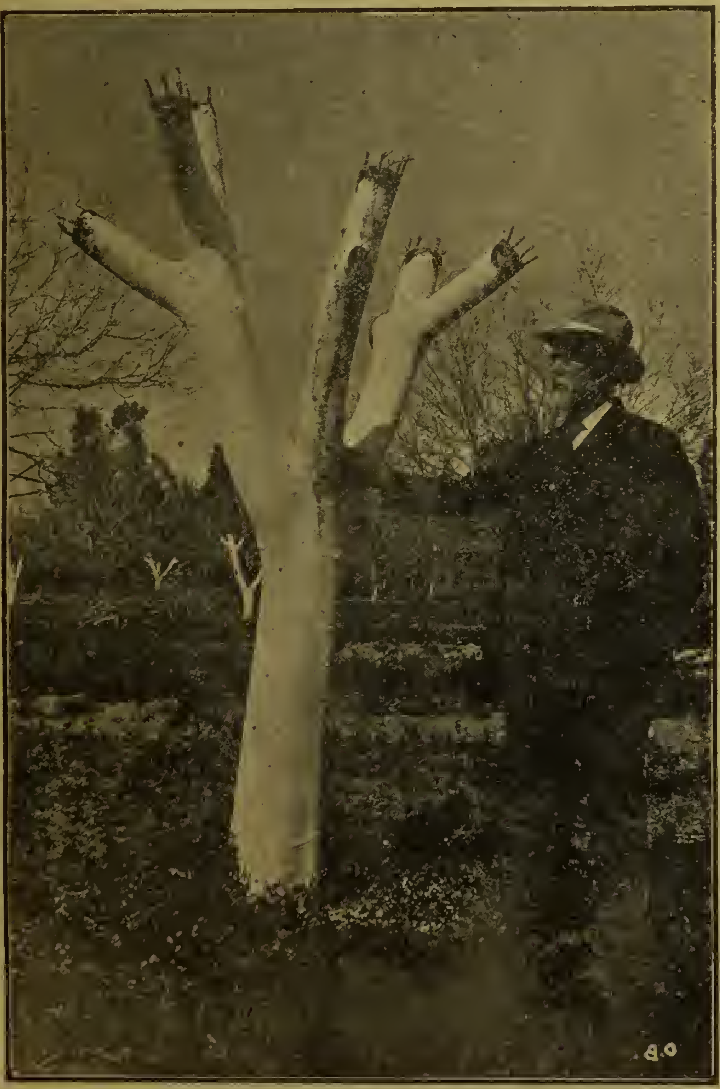
afting of the Walnut is Necessary

Some Thoughts from the Pathological Laboratory Institute and a Photograph Showing One Manner of Grafting

THE Whittier Institute the feeling seemed to prevail that lays of the seedling walnut are numbered. Prof. Smith emarked that the time is coming when the seedling walnut no more common than is the seedling apple today. The or the black walnut, seemed ne preferred stock amongst speakers, but some few still he seedling orchard. The owever, is joining with the ees which bear sparingly to growers to a realization of ition confronting them. The ice given was perhaps for er to go slow and plant only e has satisfactory trees be from the best of bearing nd so far as possible resist- light. We say so far as for no tree absolutely re- as been discovered.

urse an old grove of seed- y be grafted over, leaving es as are good bearers to ile the grafts are growing. the work now taken up in ard of J. B. Neff of Anaheim. of these trees have been his season. Mr. Neff would afted more had there been t scions from trees of known nd fairly resistant. At the Institute Mr. Neff spoke of in part as follows:

rt of the seedling walnut or- as gone over just before time ng and the trees that did not paying crop of nuts, as well e bearing small and mis- nuts, were marked so they distinguished later. By this means it was possible to leave good trees that had practically produced the crop and to the maximum production, while any increase that may m grafting will be profit.



e orchard was planted 15 years ago. The large trees had ight branches left, which were cut where they were from six inches in diameter. All other branches were taken off the body. This left stubs fom three to six feet long, and in average of six scions were placed. These scions were m a tree that is producing 200 pounds and more, of large per year. The grafting is done carefully so as to have the rk of both scion and stock on the same line, and all cuts covered with hot wax. The body of the tree is covered itewash to prevent sunburn.

s necessary to examine the trees every few days when they grow and to close any openings in the wax so the scion will not be exposed to the air. A good operator will place 300 scions in a day, and one assistant will cut the trees and wax the scions as fast as placed.

"After the scions have begun to grow it will be necessary to nail laths on the tree in such a manner that the growth may be supported by tying to the laths and the sprouts that are very close the scions should be removed, but a large part of the sprouts should remain until they are two or more feet long and then be headed back to prevent further growth, but do not cut back the growth of the scions at any time during the growing season."

The process of grafting was shown by samples of walnut branches with scions in place and by photographs of the trees in the orchard. One of these photos appears on this page, and gives a very good idea of the manner in which the scions were placed. The cleft graft plan was used, though not like the ordinary cleft through the center of the stump, but a diagonal cut is made to one side of the center in a way that the possibility is from three to six scions in each limb.

Prof. Ramsey also exhibited a style of graft, a modification of the whip graft, which has been largely experimented with by the laboratory force this year, and will later prove its worth or otherwise as the grafts grow.

As a further proof of the thought expressed at the convention, we may quote from Prof. Smith's paper:

"During the past ten years the acreage of English walnuts in Southern California has increased many fold by planting of thousands of acres of these trees. The tree is naturally long lived, hardy and a large and regular bearer. Yet during this period the crop of nuts has not only failed to increase, but has gradually decreased. The production today is no greater than it was ten years ago, with very much less acreage at that time and less than one-half of what a conservative estimate would indicate for the number of existing trees. At the same time our imports of walnuts from foreign countries are steadily increasing, so that in the year 1906 we produced about six thousand tons in California and the country imported over sixteen thousand tons, mainly from France. There is no more attractive horticultural pursuit than walnut growing. The work is clean, easy and unconfining, the product valuable, useful and not easily liable to injury or deterioration. What then is the trouble? The grower says, "'Walnut Blight.' In immune trees lies the only permanent and satisfactory solution of the walnut blight problem. That such trees are not a dream of the future, but already exist, has been demonstrated to the satisfaction of all who have taken the trouble to look into the matter."

Coulson's
Growing Chick Food

After hatching your chickens and raising them successfully up to 5 or 6 weeks old, they are worth something to you, and every one that dies now is a distinct loss in the cost of feed you have used, as well as the cost of hatching and subsequent care of them.

Therefore, in deciding what feed to use now that they are getting too large for the baby chick food, you must exercise the same care as before, to give them the best.

The Best Feed with the Least Labor

Is what you want and that is where

Coulson's Growing Chick Food

comes in.

Coulson's Growing Chick Food is rich in protein, owing to the meat and bone it contains. The grains and seeds in this food are not all ground up, a portion being granulated, so as to give their digestive organs sufficient work to insure health. The food contains a large variety of ingredients, which furnish the growing chick all it requires for quick, healthy development.

COULSON'S GROWING CHICK FOOD is especially adapted for feeding dry in hoppers, as well as dampening as a mash.

THE HOPPER STYLE OF FEEDING HAS NUMEROUS ADVANTAGES:

COULSON'S GROWING CHICK FOOD can be placed in a hopper in sufficient quantity to last for several days. If this hopper is properly constructed there will be no waste, and the consequent saving of labor in feeding is large. The chickens thrive amazingly well on it, and are kept in the most healthy condition, as with the dry feed always with them, they have no desire to gorge, with consequent digestion troubles.

Many have hesitated about trying this method of feeding by reason of the cost of the hoppers required. A good hopper for dry feeding can be made by any one at a very slight expense. We will be pleased to furnish a simple method of making these hoppers, free of charge to you.

Try the Dry Feed Method

with

Coulson's Growing Chick Food

and we are sure you will never use any other.

COULSON'S GROWING CHICK FOOD can be used for chicks from 4 to 6 weeks old up to 3 months old, when COULSON'S EGG FOOD or IMPROVED MASH EGG FOOD should be fed them.

If your dealer does not handle COULSON'S GROWING CHICK FOOD, write to us and we will tell you where you can get it.

Industry of Southern California.

urtis of the California Vegetable Union
this subject at considerable length. He
art:

the heavy shipping season, November 1
1, Southern California vegetables are
sale in practically every important mar-
e United States and Canada, and I am
say that our vegetables are looked upon with favor by the critical Eastern consumers; cars were shipped which netted the growers nearly $1,000,000.

The celery is practically all from the famous peat lands of Orange county, 6000 acres being devoted to this vegetable alone. The industry was started in 1890, but for the succeeding three or four years it was in the experimental stage, and in consequence it was well along to 1897 before any large quantity was shipped east in car lots. However, since the business was established on a solid basis, shipments have increased each year, and now California celery is a big factor commercially in all markets."

"Good celery land now sells as high as $500 per acre.

"Cauliflower is grown extensively, 500 cars being shipped during each season.

"Cabbage is produced in most all sections of Southern California, and is in market the year round. Last season over 1000 carloads went East, which netted growers about $18 per ton.

"Tomatoes form a constantly-increasing product in Southern California. The California fall and winter tomato of the Stone variety has no equal as a shipper. Four years ago no shipments were made in carload lots, but now several cars daily go out during the shipping season.

"California Bermuda onions from Coachella and Thermal are one of the new features in the vegetable line. Heretofore the most of the Bermuda onions have come from Texas, but from now on the desert section must be considered. Last season sixty cars were shipped which netted the growers over 2 cents per pound on the entire crop. This year the crop is estimated at 300 carloads, and it will only be a few years when a thousand cars will be shipped. There is a very bright future for the Coachella and Thermal onion growers.

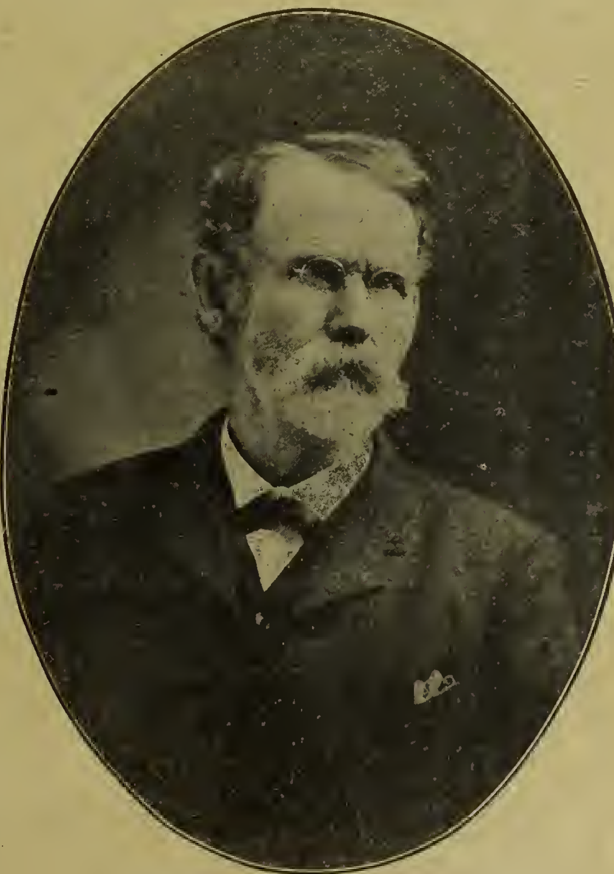
"Early potatoes are ready for market during May, June and July, and come at a time when they are wanted. While Southern California is not a large producing section for potatoes, still each year sees several hundred carloads shipped, and generally speaking, at good prices. In addition to the above, asparagus, artichokes, lettuce, bunch vegetables, green peas, string beans, and other small vegetables are grown on a very extensive basis, and most of them are to be had every day in the year."

The plan of operation of the California Vegetable Union was given in detail, with much interest, by Mr. Cronemiller, who said the union was formed to care for the celery crop of Orange county, but had grown to a much larger organization than its promoters had anticipated.

Tomato Growing.

T. M. Lambert contended that there are more tomatoes canned and shipped in Southern California than any other vegetable except sweet corn. He urged that the essential conditions necessary to successful tomato growing are good soil, ground well prepared, thorough cultivation and some irrigation. Plant in rows seven to eight feet apart, from April 15, to May 15. Thin out to permit free access of air and spraying; do not fertilize the beds, do not irrigate too much, cultivate well at first, then more shallow later. Thickly-planted plants will blight easily. Mr. Lambert said he had good success using dry-farming methods in raising tomatoes. His instructions as to picking were of interest. Most people roughly pull tomatoes from the vines, squeezing them so that injury to them makes culls. Put the hand around a tomato and, with the thumb, wrench off, but never pull nor squeeze. Use two buckets in picking, one for perfect tomatoes and the other for culls. Never ship too ripe tomatoes, and haul to market in a spring wagon. Shallow boxes do not bruise like deep ones. Never plant on low ground where there is danger from frost. In case there is danger from frost, smudge as the citrus growers do.

The blight, said Mr. Lambert, caused a loss last year of from $80,000 to $100,000 in this district. Stake your plants and keep them off the ground. By this means insects can be killed with spray.



Courtesy Rural California.

J. H. REED OF RIVERSIDE.

Father of the movement which induced the Department of Agriculture to send G. Harold Powell and his trained experts to investigate orange decay.

T. W. Phelps said he had staked his plants, but received no benefit, for they had blight just the same.

Prof. Ralph Smith discouraged the use of sulphur, and recommended Bordeaux mixture. He said it is best to spray as soon as possible after rain and between showers. Plant with the idea of spraying, make rows wide enough to drive a power machine between the rows. Be prepared to spray thoroughly and quickly. Do not wait for

Deciduous Fruit Cul

ROOTING GRAPE CUTTINGS.

IT IS a common sight to see grape cuttings in the nursery set at an angle of 45 degrees with several inches projecting above ground. This exposed top has no root to supply it with moisture during the beginning of the season, and in dry localities like the Imperial valley, they will die for an inch below the surface of the ground.

We chanced to see some young vines just from the nursery last fall that were planted at an angle in the nursery and the vines when ten months old had elbows in them that made correct transplanting impossible. Cuttings should be planted perfectly erect or near enough to make them practically straight, the top with the root. The best length for a cutting is ten inches to a foot on ordinary soil. In light soil that is apt to dry out, a little longer is better. In the clay soils of the Imperial valley, ten-inch cuttings are better than a foot where irrigation is frequent. The cuttings should not be allowed to project above the surface more than an inch and only for the purpose of outlining the rows for convenience in cultivating and irrigating. Cuttings planted deeper than ten inches or a foot will rot at the lower ends in the clay soils of Imperial, and the projecting tops will dry out. Plant so that the top bud is at the surface. If it does not start the bud below is in a good position to make a top.

When planting in the nursery in other than the desert section, we prefer to plant with one bud above the ground and the bud below just at the surface.

When planting cuttings in vineyard form, thay should be 18 inches or two feet long and the holes should be made with a bar. The soil should be settled around them with water, which can be easily and cheaply done with a tank on a wagon with a hose attached to a hydrant on the tank.

Eastern grapes do not root as readily as the European varieties, and it is best to cut the lower end through a bud or near it where the cane is enlarged. The canes of all varieties of grapes start roots more readily from these enlarged places, though European varieties start roots readily from any point where the cut may be made.

—J. W. Mills.

SPRING. REMEDIES. FOR. THE WOOLLY APHIS.

We have had another mild winter and, as a result, the woolly aphis of the apple trees has lived over in rather large numbers. The last brood of lice that came into existence in the fall very largely migrated down the trees and spent the winter in any convenient hiding place that would give them some protection from the cold. These little lice do not have the cottony secretions which give the larger lice the white color, so that they are likely to be mistaken for a different insect.

In a recent visitation of many orchards of the State, I found these young lice in very large numbers about the crowns of the trees just beneath the surface, where the earth had cracked open so that they could enter; and in some numbers upon the trunks and branches beneath scaly bark are the dead bodies of the large lice that were kille

onserving Soil Fertility

An Address before the Whittier Farmers' Institute.

BY E. L. KOETHEN OF RIVERSIDE.

HERE was a time when our or- nge growers asserted that to aply manure to the soil would the orange trees. They said soil was so rich that they would r have to fertilize. They soon vered their mistake, but we been guilty of the strangest va- s in our efforts to maintain a inuous cropping condition in orchard. All sorts of materials been tried, organic and inor- c, and all imaginable methods times of application have been rted to, until these sayings are mon. "The fertilizing problem mystery;" "No one knows any- g about it;" "No two adopt the theories." To some extent this ue. It is true that we do not v just the most economical meth- to pursue with all ranches. That are often at a loss to know just t plant foods can be most eco- ically applied. Certain forms of rials seem to give good results imes, and again, not only fail, seem to work injury. And yet, ough it all, those who have stud- the problems to best advantage, e determined on some principles underlie soil fertility, which are blished beyond controversy, and ich are a good working basis.

rhaps the experience of River- e citrus growers will be profitable use as an example of how not to it.

erside's Experience.

fter the period of "No fertilizer" l passed in Riverside, the growers ing to the extreme of using ex- ive amounts of fertilizing mate- ls. Sheep manure was cheap in se days, and great quantities were ted to the orchards. Also all ilable barnyard manure, with the ult that some groves produced enomenal crops, so heavy in some ses that the trees were so weak- ed by over production, that they ve never recovered from the ef- ts. Then came a period when ma- res had become scarce, and the e turned to the use of commercial tilizer exclusively. For a time s was conducive to good results, t soon proved just as disastrous as the former extreme, and even far more widespread. The trees became mottled in leaf and failed to bear.

In most cases the trees set a large crop, but a large percentage of the fruit never reached maturity. Either it fell off or ceased growing and produced quantities of small, thick rind, defective specimens, with a pale, sickly exterior and no flesh.

It became a serious question whether the older orchards were diseased or worked out. The age of a citrus tree for profitable bearing was seriously discussed. Young orchards were producing the profitable crops, but the old trees seemed to be diseased. Horticultural clubs discussed "Mottle Leaf" and well they might. The Riverside club set a special committee at work on the problem and their report gave three contributing causes for the trouble: Lack of humus in the soil, formation of irrigation hard pan and frost. Since that time it has been demonstrated that the latter is only a secondary cause, that irrigation hard pan is largely found by the cementing of the subsoil after the use of acidulated phosphates in soils lacking in humus, combined with a series of dry years. This humus is sifted down to be the main cause of mottle leaf. (We are not quite sure that in addition to this there was not another and an important cause. We refer to the direct deleterious effects of large applications of acidulated phosphates worked deeply into the soil, thus injuring the roots of these trees.)

These discoveries lead to another extreme in the practices of the growers. Many, many of them ceased the use of commercial fertilizers altogether and adopted the crop or barnyard manure, or both, as their only system of fertilization.

This was also disastrous. Not that the trees were injured, but the soil became depleted of phosphoric acid, and crop production fell off. Orchards that had recovered beautifully from the mottle leaf, bore heavy crops after the humus was restored for a time, but soon fell off and light crops were realized.

HARD HITTERS

Hard hitters receive hard knocks and must be made to resist them. The man who bought a nameless hammer a year ago probably has a useless hammer to-day, with a battered, chipped and broken face, and a handle that continually comes out.

To get a hammer that will last a lifetime, that never chips or breaks—that never works loose or flies off the handle—that drives straight and true—you must ask for a Keen-Kutter Hammer.

E. C. SIMMONS KEEN KUTTER TRADE ST. LOUIS U.S.A. MARK

KEEN KUTTER Tools and Cutlery

from a can-opener to a cross-cut saw—from a tack-hammer to a sledge, are as carefully made, tempered and tested as the finest surgical instruments.

COMPUTING THE COST O FERTILIZERS.

THE unit system of calculating the value of fertilizers is not as generally understood as it should be, and if the following explanation is preserved by the users of fertilizers, they can buy intelligently when they have occasion. It is purely a mathematical proposition and can only be correctly figured out by following the rules of arithmetic. Harris and Myers give us many examples, and we quote chiefly from them.

The unit system is based on one per cent or 20 pounds per ton. That is, each 20 pounds of fertilizer that is found in a ton makes a unit. If, for instance, a ton of fertilizer contains but 40 pounds of actual potash, it is said to contain two units of potash.

Suppose we buy dried blood said to contain 10.50 per cent of nitrogen equivalent to 12.75 per cent of ammonia. Quoted at $2.50 per unit, a ton would cost $31.875. This would figure out a little more than 15 cents per pound for nitrogen. If it contained 10.50 per cent nitrogen or 210 pounds per ton, at 15 cents per pound, it would cost $31.50.

If you buy dissolved bone-black guaranteed to contain 16 units of available phosphoric acid at $1.40 per unit, it will cost you $22.40 per ton.

For the purpose of converting certain chemical compounds into the equivalent of another, the following rules are used:

To convert a guaranteed per cent of sulphate of potash to an equivalent of actual potash, multiply the per centage of sulphate of potash by .54. This is because the sulphate of potash when pure contains 54 per cent of actual potash.

To convert actual potash to an equivalent per cent of sulphate of potash multiply the actual per cent of potash by 1.85. This is because the actual weight of the sulphate of potash which contains 54 pounds is 100 pounds, or one hundred fifty-fourths, which is equal to 1.85.

To convert muriate of potash to an equivalent of actual potash, multiply the amount of muriate of potash by .63.

To convert actual potash to an equivalent of muriate of potash, multiply the per cent of actual potash by 1.585.

To convert nitrogen into an equivalent amount of ammonia, multiply the given amount of nitrogen by 1.214.

To convert ammonia into an equivalent amount of nitrogen, multiply the given amount of ammonia by .8235.

To convert a guaranteed per cent of nitrate of soda to an equivalent of nitrogen, multiply the per cent of nitrate of soda by 16.47.

The grower cannot expect to get 2000 pounds of nitrogen, phosphoric acid and potash when he buys a ton of fertilizer containing them, even if he does not want anything else. The nitrogen is a gas and has to be combined with some base or heavy material and other gases in order to be tangible.

Potash cannot be used pure as it is a basis of strong alkali and must be used in combination with sulphur and oxygen when sulphate of potash is used and when muriate of potash is used, it must contain clorine gas. When you buy 2000 pounds of high grade sulphate of potash, you have to buy 920 pounds of stuff that you have no use for. Tbis is not what is known as "filler," it is the necessary combination as described above.

In 100 pounds of actual nitrogen obtained by using nitrate of soda you must use 900 pounds of soda and oxygen for which you have no use. Potash and nitrogen can be obtained from material that is very uniform in quality, but with phosphoric acid it is quite different.

When phosphoric acid is obtained from bone not treated with acid (it is then known as raw bone,) the phosphoric acid is not soluble in water and is, therefore, not readily available for the plants. The amount of available acid in a fertilizer can only be determined by a chemical analysis.

There will be found some nitrogen in the bone and the amount will depend on the treatment given the bone. If phosphoric acid could be found in as pure a combination as potash and nitrogen, we would then have to use 600 or 700 pounds of lime with it, but there are always a number of other minerals in the bone that we do not need, but they go to make up the bulk.

Suppose that we buy a ton of fertilizer that contains 1500 pounds of bone, 300 pounds of nitrate of soda and 200 pounds of sulphate of potash, what would it be worth? Suppose that it contains the following: 1500 lbs. 3.5 per cent nitrogen, 52.5 lbs.; 300 lbs. nitrate soda 96 per cent pure, 16 per cent nitrogen 46.08 lbs.; 1500 bone containing 21 per cent available; phosphoric acid, 315 lbs. 200 lbs. sulphate potash 50 per cent actual potash 100 lbs.

Calculating the nitrogen in the bone at 16 cents per pound, it would be worth $8.40, and the phosphoric acid at 8 cents per pound, it would be worth $25.20 for the phosphoric acid. The 46.08 lbs. of nitrogen at 16 cents per pound, would be worth $7.37, making a total of $40.97 for the ton of fertilizer.

Had this fertilizer contained but 280 pounds of actual phosphoric acid instead of 315 it would have shown that there has been about 170 of filler added. It takes 170 pounds of bone to make 35 pounds of phosphoric acid.

Turlock is asking for a cannery.

An orange stealer at Pomona has paid for his sport by putting up $25 fine.

An orange grove of 200 acres has just been sold for nearly a quarter of a million dollars.

Pullman, Washington, recently held a fruit growers' convention, which was largely attended.

One hundred carloads of apples were shipped from Garfield, Oregon, during the past season.

Pomona is constructing one of the most complete orange packing houses in Southern California.

Most of the orange shipments of Southern California are going by the northern roads, so as to defer the icing as far as possible.

RVING SOIL FERTILITY.

ontinued from Page 349.

the growers are settling to a more rational policy.

Rule.

rule now is, use cover—crop or rd manure, or both, as a basis fertilization. Back this up what additional plant foods are by the use of simples chiefly imal matter.

commercial fertilizers now for are tankage, bone meal, nitrate of soda and sulphate ash. It is true that large quan- of complete fertilizers are still but where there is one ton of sold there are ten tons of the es used in the Riverside or- s.

Foods Needed.

the fourteen elements necessary per plant nutrition, there are our that are ever found lacking soil to any great extent. These are nitrogen, phosphoric acid, h and lime. It will be by the chart that our soils ly contain lime to the ex- of from 1¼ to 3 per cent or 4 ent, which is sufficient under ary conditions. Government tin No. 77 on liming the soil "some authorities place the t limit at ½ of 1 per cent. s place it at 1 per cent. If the amount is the safest limit, it be seen that one of the analyses e chart indicates a need of lim- and it would pay the owner to an experimental application.

e nitrogen is the most unstable, ost expensive and the most nec- y of these elements. It is only be most careful management it can be retained in the soil out loss. Phosphoric acid is in importance, because of its parative scarcity.

tash, the fourth element, should be lost sight of, though usually dant in our soils. These ele- ts are found in barnyard manure, gh not in the best proportions fruit production.

ing mineral products, our Cali- ia soils are usually naturally in both phosphoric acid and pot- but are naturally deficient in ogen and also humus. For this on, the two mineral elements are n found in unavoidable com- nds. This brings us to the most ortant item in the question of fertility.

nus.

alley in "Principles of Agricul- " says "decaying organic matter ns mould or humus. The mineral nents may be said to give 'body' he soil, but humus is what gives life' or 'heart.'"

umus not only gives plant food the soil, but improves the physical dition of the soil and makes it genial for plants. It augments water holding capacity, modifies extremes of temperature, facili- es the entrance of air, and accel- tes many chemical activities."

does more than this, too. It fur- hes vegetable acids that act on minerals, and is life to the soil another source. It is the home or vironment in which the various l bacteria do their work.

No humus, no bacteria; no bacteria, soil fertility.

This is the dictum issued from the highest schools of agriculture today.

Again it is to the humus that we must look for our supplies of nitrogen. It is true, we could add it in the form of mineral nitrates, but to store it in that form is an impossibility. It is only when locked up in humus that a soil can be said to be really rich in nitrogen. We see then, that we are absolutely dependent upon decayed organic matter for our very existence. So, soil fertility and its maintenance after all, largely revolve around the maintenance of a supply of humus, and this is especially true of California where humus is naturally lacking.

How to Obtain Humus.

We have, in the main, three sources of humus at our command. Given in the order of their value, they are cover crop, barnyard manure and blood and tankage.

The blood and tankage, because of the small applications used, would seem to be of little importance, but it must be remembered, that their humic value as compared with barnyard manure are for blood 100 points; for manure, 3.5; for tankage, 60 points. So they may well be reckoned with as potent sources of humus. Of the manure little need be said, as its value is too well known to need extoling. But its value is not confined to the actual plant food therein contained, nor its humic values, though portions of it are much more quicklly available than is popularly believed.

We are told that it has a value not heretofore even suspected, viz.: that it can and does bring with it nitrifying bacteria which take the nitrogen direct from the air, just as those do which work on the roots of legumes. Both manure and cover crop yield to the soil a supply of carbonic acid which is essential in the processes of soil digestion. They loosen up the soil and make it friable, and develop in it latent fertility.

In addition to this, the cover crop especially improves the condition of the subsoil by penetrating it with rootlets which, decaying, leave little channels open for the penetration of air and water. It also prevents washing during heavy rains, and thus conserves fertility that might otherwise be lost.

Soil Digestion.

Finally, let us look at this question from a purely scientific point of view, and yet extremely practical. The soil may be compared to the animal stomach in that the processes of digestion are parallel. A soil may be rich in plant food and yet comparatively sterile. You may feed a man rich food and yet if he fails to digest it the man will starve. So you may place plant food in the soil and if the soil fails to digest it the trees planted in it will show all the symptoms of starvation.

The commercial fertilizers used exclusively by Riverside growers at one time contained complete sets of the elements and yet they failed to yield their nutriment to the tree, because the gastric juices were absent in the soil.

These digestive processes are complex, and are the result of bacterial activity. Crude nitrogen is converted into peptoids, and the bacili are called peptinizers.

Peptins are converted by further change due to another set of bacili

200-202 No. Los Angeles St. Los Angeles, Cal.

View of Ranch house on the best Ranch in San Luis Obispo County, contains 425 acres, 200 of which is the finest sandy sediment soil, balance grain, and pasture land. Variety of fruit and nuts; magnificent grove of oak and eucalyptus; abundance of pure soft water; improvements cost $15,000. An ideal home, and at the same time a fine investment; present owner has made a fortune on it; Buyer can lease it for $4000, cash rent. Price $55,000, easy terms; could be cut up and sold at good profit; in fact, the 200 sediment should sell for $250 an acre quick. The same kind of soil in the Arroyo Grande Valley is valued at $500 per acre for seed ranches.

I also have a Ranch of 110 acres adjoining the town of Nipomo, all fine, rich bottom land, with $9000 worth of first class improvements, consisting of splendid home of 10 large rooms, 2 cottages rented, 2 fine barns, and water piped to all buildings; $14,500 takes the whole thing, easy terms. They are asking $150 per acre for the same kind of land in the neighborhood. This would cut up and sell in small blocks nicely; in fact, it is already plotted and maped in town lots, and there is a strong demand for small places of this kind of rich land. I also have a delightful country home one mile from the city of San Luis Obispo for $10,000.

San Luis Obispo County Farmers are making money, but prices of our lands are behind the times. Write me for what you want.

Citrus Growers Aid

An address on the Citrus Grower and the Pathological Laboratory at tl tier Institute.

BY C. C. TEAGUE OF SANTA PAULA.

IN THE fifteen years that I have been actively engaged in horticulture in this State, I have met so many problems that I could not even intelligently attempt to solve, and which require a technical, scientific education, that I feel that I am competent to testify as to the benefits of scientific investigation in horticulture. It is difficult to estimate the vast amount of good that has been done and is being done by the gorvernmental investigations, State and national, that are being constantly carried on by scientific men, particularly during the past few years, for the betterment of the products of the soil.

There seems to be quite a general opinion among some of our horticulturists and farmers that the men engaged in this work are not practical men, and that the money appropriated for that purpose is not well spent. I feel very sure that any fair-minded man can soon disabuse his mind of that opinion, if he will take the trouble to get a list of the bulletins published by the government and by our State university, and send for and carefully read some of them on the subjects in which he is particularly interested.

It has been my privilege to meet and become well acquainted with a number of men both under the Department of Agriculture and the State University, and I have found them, without exception, to be earnest, able men, striving honestly and intelligently to solve the many problems which vex us.

In my opinion, the public money which has been spent in research for the benefit of agriculture, horticulture, forestry and stock raising, has brought many times over more direct monetary returns than public money spent for any other purpose. Here in Southern California where on account of such a diversified climatic and soil condition, our soil products are so varied, we particularly need this pathological laboratory, and its corps of trained men, to whom we may take our troubles. To me it is a source of great gratification and comfort to feel that these men are here to protect the interest of the fruit industry, which is of so much and of such increasing importance to the State.

The citrus business is by far the most difficult of any branch of horticulture. That is to say, it requires more knowledge and intelligence and painstaking effort. Therefore, its needs for a pathological laboratory are very great. After all, none of us know much about the business. Who is there that knows anything about "Puff in Oranges," "Variegated Leaf," "Center Decay in Lemons," "Black Speck," (which has been troubling orange growers this year;) "Why some trees in your grove thrive and others do not under same treatment," "Pitting of Lemons," "Dry rot in skin of lemons."

I think I could almost add "Fertilization," to the list of diseases of which we know nothing about, and as deserving of consideration by our partological laboratory, for an improperly fertilized grove amounts almost to disease. As a positi of what has been accomplis the men in charge of our path laboratory, I would particula your attention to brown lemons. Four years ago this infectious disease put in its ance in our groves, it being ticed in the curing house, an wards was traced to the grov it originated, and where it still continues to do some but the principal damage was fection of the washing mach the diseased lemons which through them, thus transmitt disease to a large percentage sound lemons. How this tro might also say "menace" to t dustry,—was mastered, and th age reduced to a minimum, is detail by Professor Ralph E. bulletin on "Brown Rot Lemon." That the trouble w tered I am positively able as the Limoneira Compa alone by brown rot during t prior to the university inves was at least $20,000, and sin time has practically amou nothing.

But even if you feel satisfie the present condition of your g and none of these problems ar rying you today, do you feel that tomorrow some trouble m beset your grove with which will not be able to cope? B means, then, let us stand toget support of this pathological l tory, which means so much f good of the citrus industry. It duty of every grower to see to i sufficient money shall be appr ed so that the grand work of th stitution shall not in any wa hampered, and to give to this tution every aid in his power.—Teague.

BURNING OUT STUMPS.

The following method of disp of large stumps is very effica and labor-saving. Whether it w be applicable to small hard stumps I do not know, but it is a trial. The principle is the in burning charcoal, and I would apply to any wood tha make charcoal. To clear la large stumps, dig a fair-size down by side of stump and b fire of pieces of good firewoo snugly against the stump. Gr cover the fire with soil and keep ered; if well started and kept ered by occasionally throwing soil on where it is likely to b out, the fire will continue until the whole of the stu burned into charcoal. On sou our large fir stumps, 10 or 1 across, the fire will burn two m or more, and follow roots 10 feet underground.

Capacity of a ten-ton freight Salt, 70 bbls.; lime, 70 bbls., f 90 bbls.; eggs, 130 to 160 bbls., f 200 sacks; cattle, 18 to 20 he hogs, 50 to 60 head; sheep, 80 to head; lumber, dry, 10,000 feet, l ber, green, 6000 feet; barley, bushels; wheat, 340 bushels; ap 370 bushels; corn, 400 bushels, p toees, 430 bushels; oats, 680 bush bran, 1000 bushels.—Ex

es and Their Care

QUEEN-REARING.

QUENTLY I am asked wheth- it pays a producer to rear his n queens. This is a rather estion to answer, for so much on the ability of that pro- and on his experience in rear- d queens, says a correspondent anings. Many circumstances ve a bearing on the subject, the number of queens required y, the kind of honey produced, r comb or extracted, the time rplus is secured, and the lia- f the young queens mating with able drones. All these circum- and many more should be well red before the producer de- o rear his queens. If he has colonies, and is anxious to ll he can about bee-keeping, auy regard to the amount of he may secure, then I would him to purchase a good breed- en and learn as soon as possi- w to rear choice queens. In a his experience will be worth to him as long as he continues p bees.

t in North.

of the worst troubles in rear- large number of choice early here at the North is our cold rd spring weather. We use 00 young queens a year in our and have tried many times to em during the latter part of nd fore part of June, so as to hem laying about June 10; but almost impossible to rear so good queens at that season of ar. If we wait till the latter June to rear them, then the rom these queens are of but se as honey-gatherers until he best of the harvest is over. find it much better to pay con- le money each year for our instead of trying to rear them. t the first of December we gave d queen breeder our order for eens, to be sent us between the 20th of June next. It requires bees, skill, and honey to rear ueens; and when they can be t for from $65 to $75 per hun- and extracted honey is worth 7 cents per lb. by the carload, it ot pay to sacrifice much surplus er to rear queens.

Understand.

n the ordinary honey-producer ts to rear his queens he is very make some serious mistakes, through ignorance and partly h a lack of time to give this f his business the close atten- t requires.

e would procure a good breding- and rear all his queens from her, weed out and destroy all small r queens as soon as they hatch, ght have choice queens without expense except for a part of his and a certain per cent of his s. There is quite a difference nion as to the necessary amount s it requires to rear choice cells ueens. Some claim it can be with but few bees; others want colonies to produce choice I know we could never rear s that would suit us unless we so many bees in rearing our that it would make a sad inroad r surplus honey.

Cause Swarms to Degenarate.

most common and the worst ke that can be made in rearing queens is saving the natural cells and virgin queens from colonies that have cast natural swarms. I have heard this method recommended by men who were considered quite good authority, and it seemed as if I could not keep still and listen to them. We spend valuable time at our conventions in discussing various ways for preventing natural swarming, and we frequently see long articles in our journals from noted writers recommending certain methods to prevent it. Almost daily during the summer season we see bad results in our apiaries from excessive swarming, and then so many will do the very thing of all things that will perpetuate the desire to swarm, by saving seils and virgins from the colonies that are the first to swarm; and invariably when this objectionable method has been practiced a few years a strain of bees will be developed that is ready to swarm both in season and out of season. Nor is this all; for a great step backward is taken, and the bees from the first will begin to degenerate, and part of their yellow color will be lost; and the bees themselves, being crosser and more irritable, they fail to gather as much surplus, and they become more nervous in winter. In a few years the apiary will have degenerated until it is of but little value. It must then be built up again with good stock.

In view of these facts do not take such a step backward as will bring only loss, trouble, and disappointment. When a colony has many valuable traits, send its queen to your queen-breeder, and write him, describing all those good points, and request him to rear the queens from her unless he may have a still better breeding-queen. In this way the choicest of queens may be reared from the best stock and improvement can be made along the lines most desired.

As I look back I find that the seasons when we received our largest surplus have been, without a single exception, the ones following the year when we reared our queens from some special queen whose colony had given us an unusual amount of surplus the previous summer. It requires only four or five years of careful selection to make a great change in bees in their honey-gathering qualities, and in their disposition, until they seem like a different race of bees. The color is one of the quickest of all points to show improvement, and the tendency to swarm can be reduced to a surprising extent; but special care must be taken to select the best standard. Nor is this all. The drone-mothers must be just as choice as the queen-mothers. You must rear all drones from as choice queens as you rear your queens from. In other words, drones must be developed the same as the queens. This may seem like an unnecessary amount of trouble; but there is little of value in this world that does not cost labor to acquire.

There are many bee-keepers who might make great improvements in their bees if they would only start in the right way. They seem to think that, if they buy a breeding-queen once in a year or two, it is about all that is necessary; and if her colony swarms they will try to save some of the queen cells, and then think they are improving their bees. Such a line of management is no improvement; and if that is the best that can be done, then it would be better to buy all the queens from some one who is doing better. The whole subject turns on this point: The best queens, bought or home-reared, are none too good, and the aim should be to make them still better with each succeeding generation.

What is the difference between recollect and remember?

Well, I recollect lending you $5, but I don't remember ever getting it back.

THE BEST LINIMENT

Kill the Pocket Gopher, Moles and Squirrels

The Peerless Destroyer generates gas from carbide (a cheap substance, which can be bought anywhere,) instantly forces the gas into their holes at the rate of five feet per second, for hundreds of feet, making a wholesale killing of every live thing therein. They stop breathing when the gas overtakes them. No pumping, no trouble. The gas is harmless in the open air, but confined in their holes kills them by the dozen in a single operation. Not an experiment, but a sure thing. FULLY GUARANTEED. Perfectly safe, easy to operate, fully meets the demand for a wholesale destroyer of the pests. Will last for years. The cost is nothing for the work it will do. Full equipment, including sufficient carbide to clear any ordinary ten acres, ready for instant use, sent express prepaid on receipt of price, $5.00, without carbide $3.50. Your money back if it fails to do the work. Write today.

Handling and Transporting Citrus Fruits

An address before the Southern California Pathological Laboratory Instit

BY G. HAROLD POWELL.

Mr. Powell's success in suggesting remedies for the great loss in orange sh has been remarkable and calls attention to the good work which the Depart Agriculture is doing for the farmer. The following article is a short resume Powell of this work.—Ed.

I desire to summarize the work of the Bureau of Plant Industry of the U. S. Department of Agriculture, in investigating the decay in oranges while in transit from California.

The losses from decay were estimated to vary from one-half to one and a quarter million dollars annually a few years ago.

It was a loss of that amount of money to the grower and to the shipper. It was one of the leading factors in the frequent demoralization of the Eastern orange market. It gave the California orange a reputation for poor keeping quality that does not belong to it; and as the causes of the decay were not clearly understood, the responsibility for the trouble could not be fixed. It led to difficulties between the shipper, the transportation companies and the receivers.

Through the persistent appeal of Mr. J. H. Reed, of Riverside, who recognized the magnitude and complicated nature of the problem, the Department of Agriculture was induced in the winter of 1903-04 to undertake the investigation, since when it has been carried on during each succeeding shipping season.

In passing I cannot refrain from saying, that in my experience in California in the last five years, I have met many progressive men connected with the citrus fruit industry, the peers of any other class of men engaged in American agriculture. I do no one an injustice by saying that it has not been my privilege to meet a more far seeing, loyal and wholly unselfish public-spirited worker in the interest of the citrus fruit industry than Mr. J. H. Reed.

In order to conduct the investigation it has been necessary to develop an organization of scientific men who would command the confidence and could work harmoniously with the growers and shippers in California, with the transportation and cold storage interests, with the receivers in the markets, and among themselves in scientific team work.

The present staff that works on the Fruit Transportation and Storage Investigations is composed of A. V. Steubenranch in charge of Cold Storage Investigations in California; L. S. Tenny in charge of the Citrus Transportation Investigations in Florida and also in general charge of the Fruit Inspection work in New York; H. J. Eustace in charge of Fruit Storage Investigations in the central United States; S. J. Dennis in charge of the engineering problems in Transportation and Storage and G. W. Hosford and H. M. White, who are connected with the Transportation and Storage Investigations in different parts of the United States.

In this discussion I desire to summarize the results of the investigation rather than to make a detailed discussion of it, leaving the details for a report that will be issued from Washington in the near future.

The Cause.

The decay in oranges in transit from California, is due to a blue mold fungus which enters the fruit through mechanical abrasions of kinds, or other types of weakness. It is not uncom find from 5 to 50 or even 75 of the oranges injured visi most common injuries being by the clippers, by stem p gravel punctures and impro inghouse facilities. These are often the result of ignora the part of the grower and but are generally caused by of labor hiring, of fruit handli packing that place a premium quantity rather than the qua the work done. There has vast improvement in the hanc the fruit in the last few year the substitution of day-paid under competent supervisio piece-paid labor, to the picking fruit by the associations rath by each member of the asso to the simplifying of packin equipment, and to a general tion that the elimination of chanical injury of the fruit is the large problems for the cit dustry to accomplish. It is from our work this year tha are still many growers and who are either indifferent to th tion or who are finding it to an undertaking to accomplish.

Eternal Vigilance.

On the other hand, we have ant data to show that fruit handled on a large commercia without serious mechanical To accomplish this is a mat business policy, of good men eternal vigilance.

The specific investigations from the determination of m cal injury, have been conduc bring out the following points

(1.) The decay in oranges h in different ways for shipmen holding the fruit in packing in California about two weeks.

(2.) The decay in oranges h in different ways for shipment forwarded at different leng time after packing, under ven icing and pre-cooling.

(3.) The decay in oranges in different ways before and forwarded under differe tions, the decay being determ intervals during a storage fruit in common storage roo the Eastern markets.

Some Data.

There have also been accu technical data on metho pre-cooling, on the changes i perature in cars during the continental trip when shipped ventilation, icing and pre- and on the cold storage of fruits.

In the packing house exp which have been conducted in parts of Southern California fo educational effect, the oranges are free from mechanical i and are handled in a simple develop the least decay; brush creases it slightly, washing creases it still more, especially water becomes infected with t cay spores, while the mecha injured oranges develop the mum amount of decay.

or Season has No Effect.

as been shown also that there e difference in decay in or- grown in different sections, handled in a similar manner; ere is little difference in decay nges picked from the same from January to May when d with care; that the general n that the decay is less where s are cured before packing, and he fruit is particularly suscep- o decay before the trees bloom, o basis in fact.

tness in Shipping a Factor.

the shipping experiments the decay has developed while in t in the sound, carefully- ed oranges under all methods of ent, and, the greatest in the anically-injured oranges. From tandpoint of the promptness of ng after packing, the decay has sed as the time between pack- nd shipping has been length- the greatest decay occuring in nechanically-injured oranges.

ooling.

to the influence of the method ipment, the least decay has de- ed in the pre-cooled fruit load- cars in cold condition. Pre- ng is not essential to overcome , as it can be avoided by hand- the oranges carefully. It does emove the cause of decay. It retards the development of rot while the fruit is cold in the oranges that have been made susceptible by improper handling.

In the tests of the keeping quality of the fruit after arrival in market, the fruit that is free from mechanical injury keeps the best, while the greatest amount of rot develops in the oranges that have been roughly handled and mechanically injured.

Sound Fruit the Basis.

Sound fruit is, therefore, the basis for sound keeping quality while in transit, and it is the only fruit that keeps well after arrival. The oranges that are picked improperly, that are handled through complicated machinery or that are injured in any other way are the principal ones, aside from the low grades, that rot while in transit and that bring the California orange into disrepute in the markets of the country. The matter is so plain and so clearly within the grasp of those who handle the fruit, that the shipper who persistently impairs the standing of the industry by shipping fruit to market that rots, ought to be looked upon as a detriment to the business. A car of rotten fruit lessens the confidence of the buyer in every other car that is sold in the market on the same day.

Temperature Changes in Transit.

In the tests of the changes in temperature in cars while in transit, it has been found that the temperature of the fruit changes slowly. Under ventilation there may be extremes in the change in outside temperatures with relatively small change in the temperature of the fruit unless the extremes persist a long time.

Under icing, the temperature of the fruit falls relatively fast during the first few days of the trip, and a train may cover one-third of the trip across the continent before the temperature of the fruit reaches 50 degrees Fahr. The decay develops during the first of the trip while the fruit is warm, provided the oranges have been improperly handled.

In a car in which the fruit is cooled to 40 degrees Fahr. or lower before shipment, the temperature remains constant, if the car is re-iced regularly in transit.

Appreciation for Co-operation.

In closing this summary, I desire again, as I have done many times in the past, to express the appreciation of the Bureau of Plant Industry, and the grateful appreciation of all of us who have been connected with this work of the splendid co-operation of the growers, the shippers, the railroads, the cold-storage interests and the receivers in New York. This co-operation on the part of the various interests connected with the citrus fruit industry and the quick application of the results, has not only made the investigation possible, but it has been the chief source of encouragement and inspiration to those who have been officially connected with the work.

CHRYSANTHEMUMS.

Some months ago the Cultivator announced the death at North Pomona, of W. H. Marugg, often known as Billie Marugg, of the Pomona Floral Nurseries, and that his business would be conducted by his mother, Mrs. Julia A. Marugg. Mrs. Marugg is now making her first announcement for the coming season. She has a large number of plants of the famous prize winners exhibited at the Southern California flower shows. An order placed with Mrs. Marugg will secure early delivery of these choice plants.

A WORK OF ART.

A beautiful Transvaal daisy on its cover, gives a unique character to the new catalogue just issued by Howard & Smith, nurserymen, of Los Angeles. The catalogue is of ornamentals. The rose claims first place, but dahlias, cannas, chrysanthemums, phlox and a host of others are given prominent place and fullest illustrations. The illustrations are all new and original and add beauty to the work.

One lot of 50,000 sheep will be shipped to Eastern markets from Butte, Montana.

CONSERVING SOIL FERTILITY.

Continued from Page 351.

to ammonia, and are called ammoniafyers.

The next link in the chain are the nitrifyers which change the ammonia to nitric acid.

The final change is to nitrates; all due to bacteriological activity. In this process carbonic acid is liberated, which in its turn renders the potash in the soil available for plant food. All this process must have the humus as a media in which the bacteria can live.

Moisture Necessary.

Again, unless a sufficient supply of moisture is present, these processes will fail to operate. Humus in the soil helps to retain a supply of moisture, so again we fall back on this valuable material.

Culture.

It is true that culture tends to make available plant foods that are in the soil, and with good culture the natural fertility will be more quickly exhausted than without, providing no new plant foods are added, but culture also adds fertility, in that it makes useful inert matter that might otherwise be inert for centuries. Of no mean importance in this connection is the admission of air. What! do you say the air breathes?

Yes, it actually breathes in its way. With changes of temperature and moisture conditions there is secured a free circulation of air in the soil (and the bacterial activity depends upon this for its very existence), providing cultural methods are pursued that make it possible. Hence, the necessity of deep and thorough cultivation to open up the air channels.

What do we mean by culture? Well, one thing we mean is to break up the soil again into as small particles as possible, because in so doing we can greatly increase the surface of the grains and these increase their exposure to the action of water, chemical compounds and acids, and the water holding capacity of the soil.

The soil may be made up very largely of materials extremely difficult of solution, but in thus fining the soil particles, the task is accomplished to an enormous extent .

King in his book, "The Soil" gives an illustration of this, by which he shows that a marble an inch in diameter, will hold a film of water on the outer surface a little over three square inches in area. The same material ground to a diameter of one-thousandth of an inch, which is not an extremely fine grain, would yield an aggregate surface area of 3141½ square inches. "A cubic foot of soil grains having a diameter of .001 of an inch, will provide a surface for holding water, as we have seen the marble do equal to 37,700 square feet. Four feet in depth of such a soil, would possess a water-holding surface not less than 3.4 acres for each column of soil one square foot in section." An extremely thin film, therefore, on such a surface, must aggregate a large amount of water."

By culture we also mean to so break up the soil that free access of air may be gained to the soil at the lower depths. The particles of soil being separated from each other, leaves an air space in the crevices between them, and this is essential to the life of the soil bacteria.

The analytical chemist can tell us just what plant foods are fou our soils, but he cannot alwa whether it is in that form whic be available to feed the crop grown on it.

The bacteriologist can, by a of the soil, tell us if the soil are at work. He can determin what links in the chain ma missing, and the time is probal hand when he will inform us such an examination, by countin bacteria found, whether the s sour or sweet, whether by ca handling we have impregnated soil with poisonous gasses and dered it lifeless. Whether by e sive moisture we have destroye life of the soil.

In the meantime, we do not that if the soil is in a conditic grow a luxuriant cover crop.

If it is loose and friable, well t intelligently irrigated and well plied with essential plant foods f rounded ration, including an ab ant supply of humus, avoiding fertilizers which might be of dc ful charcater, (by this we refe materials that may contain injur substances, such as chlorine or cessive amounts of soda,) we sure to maintain soil fertility and tain good wood growth and fruit

GOOD WORD FOR THE COYOT

"Action of the governm through its subordinate forest serve officials and others, in operating with the stockmen for annihiliation of the coyote," s Alfred Penny, of Naches, to the kima Republic, "is in my mind rather serious matter which sho be deeply considered by the orch ists. There are two sides to ev question and I have grave dou whether the benefit to accrue from slaughtering of the coyotes can proven to be positive.

"The coyote is the natural ene of the rabbit and it is the rabbit have to fear here more than a thing else. We can guard against coyote but we can't guard ag the rabbit. At least not effectiv We know absolutely what the rab has done to the people in Aust and we know also what we have su fered from its depredations.

"We know that the coyote kee the rabbits under subjection. W know also that rabbits, unmoles and in a country where food is p tiful, especially in a climate as mi as this, multiply most rapidly. No if we kill off the coyotes what there to prevent an enormous i crease in the number of rabbits, pecially as the country, under irr tion, is yearly becoming able to s port more?

"Stockmen are practically the ones who suffer from the coy and their losses, while large in aggregrate, are not as large as generally supposed. It is a questi of the greatest good to the great number. In many sections of State now rabbit drives have to resorted to as a protection, but spite all efforts they continue to crease. The coyote, we know, wi not touch horses or horned catt and so far as the feathered flock concerned, we can protect it at ni That leaves the sheep and, in measure, they can be cared for. H can we fence against the rabbit What way is there of protecting a young orchard?

"Fruit is destined to be the paramount industry of this valley at no very distant date. We should prepare to look forward to that time now. The government, in the last report of Secretary of Agriculture Wilson, pointed out the extent of the complaints of the great damage done by rabbits, mice, rats and other field pests and of the efforts made to find some protection. Now we know that the coyote is a protection and that the good he does, by killing the pests, more than offsets his harmful side when he takes a lamb or a chicken."

eries and Replies

s to be answered in this department should be received at this office before reply is expected. Write plainly on one side of the paper and name and address. Unsigned communications receive no attention.—

Trees.

ood plan to whitewash the small peach trees? If so, d the wash be mixed and re be anything but un- e and water in the mix- E. P., Porterville.

cale, spray with sulphur and h or kerosene emulsion, ll kill the aphis. If for codling moth, spray with Paris green or arsenate, which will not affect the wooly aphis. If for scab spray with Bordeaux, which will not touch the aphis.

Whitewash for Trees.

I am planting almonds in the foothill section of the San Joaquin valley; shall use tree protectors. Would it be of any benefit or protection against insects or borers to whitewash the young trees? If so, how should it be made to answer this purpose and to adhere to the tree?—"W."

Make an ordinary whitewash and add to each five gallons a double handful of salt and a half pint of thin glue. This will stick and prevent borers and sunburn from injuring the trees.—J. W. M.

Scours.

Will you kindly tell me what to do for a calf that has looseness of the bowels? It is three months old. It has been fed on warm, sweet, skim milk, with a very little oil cake meal added; has not been overfed. The calf does not act sickly, but is very loose, discharges dark in color.—Subscriber, Fresno.

Give this calf a little rennet in its milk. Drop the oil meal or reduce the quantity one-half, using blood meal instead of the all oil meal. When scours become at all white in their character give formaldehyde, one teaspoonful in fifteen ounces of water; two or three doses usually cures the calf.—M. E. S.

Poll Evil.

Will you please tell me through the Cultivator if poll evil is curable, and which, in your judgment, is the best remedy in affecting its cure.—Subscriber.

Yes, but very tedious, owing to the many tendons in the head. In the ordinary fistula of the withers the mass can be readily cut out and promptly cured. In poll evil or fistula of the head, the best treatment we have found is to be to clean out the pus with warm water and a little oxide of hydrogen, one tablespoon to a quart of water, when the parts are clean wash the rest of the outside of the top of the head with the same wash, then inject peroxide, one part to four of warm water. Cover with gauze and put a muslin hood on the head. Change and treat the same way every day until the fistula heals from the bottom up. Two weeks' time will show you good results. Feed liberally, using half bran with the grain.

Poland-China and Berkshire.

Kindly inform me in query column as to advisibility of crossing Berkshire boar on Poland-China. I have both full blooded stock and would like to know as to the wisdom of such a step.—M.

Cross breeding is a common practice, as many breeders think this cross makes a more hardy and prolific race of hogs. It always seems a pity to cross any breed of pure bloods for its results in bringing out qualities that have been carefully bred out by great care. I should prefer every time to raise some young pigs in a more natural way on a range of alfalfa, giving them a slop of sweet

MORSE SEEDS SPROUT—YOU AND NATURE DO THE REST
PACIFIC COAST HEADQUARTERS for BEST SEEDS

SEEDS We Grow Them—YOU SOW THEM

If interested in a quick growing valuable tree you can plant on unused ground read the following about

ACACIA MELANOXYLON

Baron Von Mueller, in his "Select Extra-Tropical Plants," writes of this tree:

"This well-known Blackwood of our river flats and moist forest valleys. In irrigated glens of deep soil, the tree will attain a height of 80 feet, with a stem several feet in diameter. The wood is most valuable for furniture, railway and other carriages, boat-building (stem and stern posts, ribs, rudder), for tool handles, crutches, some portions of the work of organ builders, casks, billiard-tables, pianofortes (for sound boards and actions), and numerous other purposes. The fine grained wood is cut into veneers. It takes a polish, and is almost equal to walnut. Our best wood for bending under steam; it does not warp or twist."

The great billiard-table firm of Alcock & Co., in Sidney and Melbourne, have been making tables from it for the last eight years, and at the exhibition of 1888, there was a piano cased with it which was as handsome a piece of parlor furniture as one could wish to own. The Martini-Henry Rifle Co. have been using it for gun stocks for the last fifteen years, because they could get it much cheaper than the French walnut hitherto used by them.

We have a fine lot of these trees, which you will find priced on page 73 of our 1908 catalogue, mailed free, on request.

skim milk with a little blood meal, about a teaspoon full to each pig, and enough shorts to keep them squealing at feeding time. These little sows I should expect to breed to a boar of a distinct out-cross strain of the same blood with good results. Pigs are cleanly animals, but we confine them in filth and give them dead animals to eat and then are surprised that the breed runs on our hands.—M. E. S.

Balanced Ration.

Will some one please give a balanced ration for farm horses of the following feed: Alfalfa hay, calfalfa meal and rolled barley. I'm a tenderfoot from the East, and do not know how to proportion the above. Is there anything better that would cost about the same?—W. R. P., Kerman.

Feed the horses four or more quarts of rolled barley at a meal. More, if they require it. Give them all the alfalfa hay they will eat up clean twice a day, morning and evening. Alfalfa meal is not necessary for horses as they have good teeth.

Feed for Horse.

I have a horse about six years old that it seems almost impossible to keep in good flesh. He is a sorrel of the rangy sort. I feed all the wild oat hay he will eat up clean and two quarts of rolled barley twice a day. I had his teeth filed about a month ago and it seemed to help him some, but he is still poor in flesh. He appears dull and languid. The only unfavorable symptom that I can notice is the unusual amount of wind that he passes (no unusual odor to it however,) especially when driving or drinking at the ditch he will pass wind for nearly half a minute. We drive him about nine miles every other day.—C. I. L.

This is a hard type of horse to keep in flesh. We breed away from them on the ranch. I should feed him a mixture of bran, rolled barley, with a little oil cake and sell him when he is in good condition to some one that feeds grain all the time. Wild oat hay is a very variable food, some time almost without value if composed of inferior growths and not cured without receiving rain. Perhaps when you have added a little rolled barley to the horse's feed you may find he improves so much that you will think him too good for the other man's use and keep him yourself. A little soda, baking soda, will relieve the wind in the stomach and not injure the horse's digestion.

Milk Fever.

My cow is due to calf in March. She is a Jersey and this is the third calf. Please give me some hints as to treatment so as to avoid milk fever, etc., and oblige.—D. S. W., Covina.

The recent article on milk fever answers this question most fully.

Alfalfa for Silage.

I wish to put first cutting of alfalfa into silo. Should it be run through cutter and ought it to be partly cured before putting in silo? How long before it is ready to use? Give remedy for scours in calves.—S. C., Los Angeles.

Alfalfa is run through the cutter to make it pack well in the silo. Uncut stuff in the silo is very difficult to handle at the time of feeding, as it makes the surface irregular on the top of the silage and this promotes decaying. Put the alfalfa at once into the silo; usually the teams follow the mower after half a day's time with us. This does not give the alfalfa time to wilt very much as it is raked up at once into cock to help it retain all its moisture. Silage can be used at once or it can be allowed to mould over the top and keep indefinitely.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

For calf scours, always feed the milk warm. Add rennet as follows: Buy at the grocers or druggist a package of rennet tablets, those used for making junket will answer. Dissolve the tablets in warm water according to direction, allowing one tablet to every quart of milk to be fed. Carry the dissolved tablets down to the feeding pen and add them to the milk the last thing, to prevent its curdling before the calf can drink it.

To Keep Birds from Corn.

I noticed in your last paper a query from subscriber wanting to know what would prevent birds pulling up corn. I have a plan that I followed for a number of years in the East with success. Roll your seed corn in gas tar until it is well painted and let it dry a few hours before planting. I have found this most effective.—F. W. Noel, Dinuba.

Croppers' Share.

Please let me know through the Cultivator what is the cropper's share and the land owner's share? If cut for grain and threshed, who gets straw and pasture? This is where there is no contract.—J. S. R., Paway.

We do not think custom has established a fixed rule for division of the crop. If so, we will be glad to learn from those who may know of it. Where grain is the crop and the agreement is for the crop to be divided on a certain percentage, we should imagine the "crop" would not only include grain but straw and even pasturage, if any. It is plainly a question of agreement.

Oiling Slicker Coat.

Referring to query in regard to oiling a slicker, a friend tells me he has often done it with success, using boiled linseed oil to which is added Japan drier in proportion of tablespoonful to pint of oil.—J. C. Perry, East Highlands.

A Beautiful Shrub.

Will you not kindly inform me as to the name of the bush of which the enclosed is a sample.—A Subscriber, San Jacinto.

It is Cassia artemesioides, a most beautiful shrub.

Calla Bulbs.

Would be glad for an answer in "Queries and Replies" to the following:

On first page of last week's Cultivator you state that calla lily raising "has not proven a success financially." I have been told that raising the bulbs for Eastern markets is a very profitable business and had thought of going into it. What are the real facts concerning this matter of raising calla bulbs for the Eastern trade, which is claimed by some to be very profitable. In your estimation, which would bring the larger returns financially, an acre planted to strawberries or the same planted to callas for bulbs.—Subscriber, Santa Cruz.

The above was submitted to a seed grower, who at one time had ten acres of callas. After several years' experience he "broke even," paid off his help and quit. His greater returns came from dealing with local seedbuyers. Eastern shipments were sometimes disastrous. The rot which sometimes attacked the roots was also perplexing. It is impossible to say as to whether it will succeed

Curing Ripe Olives.

Would you kindly insert in a number of the "California Cultivator" a recipe for the preparation of black olives.—Subscriber, Mountain View.

This has been given many times and still the requests come. But in condensed form it is:

The successful production of pickled olives is a matter of experience and depends almost altogether on the individual judgment and skill of the producer. No method can be given which is suitable to all cases, and the best method must be modified according to the nature of the olives to be treated. The following scheme, therefore, is to be considered as mere outline to be carefully adapted and modified by the operator at each stage of the process:

Lye process: 1. Place olives in a solution composed of two ounces of Babbits potash lye to one gallon of water for four hours. Repeat this once or twice, if necessary to sufficiently remove the tartness.

2. Rinse the olives thoroughly and replace the lye solution with fresh water. Change the water twice a day until the potash has been removed from the olive, as judged by the taste.

3. Replace the water with brine composed of four ounces of salt to a gallon of water and allow to stand for two days.

4. Put in brine of six ounces of salt to a gallon for seven days.

5. Put in brine of ten ounces per gallon for two weeks.

6. Put finally into a brine containing fourteen ounces of salt to the gallon of water.

In order to make this process a success, the following considerations should be kept in view:

1. Great care should be taken not to allow the olives to come in contact with anything that will injure their flavor. The vats or other receptacles, used for pickling should be perfectly clean, odorless and tasteless. Earthenware is the best material, but it is usually cheaper and more convenient to use wooden receptacles thorughly treated with boiling water and soda until they are sterilized and all taste of the wood removed. Any wood (such as pine) with strong taste should not be used. The vats should be provided with a removable wooden grating, fastened one or two inches from the bottom, and a close-fitting, floating wooden cover to prevent access of air, which spots the fruit. On top of the vats should be placed a cover of thick cloth or of wood to exclude the light and dust. Each vat should be provided at the bottom with a wooden spigot for drawing off the solutions. The thickness of the layer of olives should not be more than two feet or less with soft varieties.

2. It is best to use good potash lye. The principal adulterant is common salt, and if salt or overripe olives are being pickled, this may be an advantage, as it keeps the fruit firm.

The Vegetable Garden

THE HOME GARDEN.

THE financial importance of the home vegetable garden is rarely appreciated, except by those who have all their vegetables to buy. Such a garden, even in its highest degree of perfection, may not bring in one cent, but it is difficult to estimate the dollars it keeps in the family purse. Its importance should be estimated from the amount saved and not from the amount made or cleared; and aside from the economy, pleasure and commendable pride that the owner derives from a well kept garden, he has the satisfaction of knowing that he is providing his family with fresh and wholesome food, lessening his drug and doctor's bills, and very probably prolonging the lives of those dependent upon him.

Our favorable soil and climate, increasing big population of cities, and better transportation facilities have made possible the development of the vegetable growing industry, whether the product is intended for home or Eastern markets. Few avocations require more intelligence and business tact than truck farming, and experience is necessary to its successful undertaking. The average man who, for the first time, engages in truck farming does not appreciate, or even recognize, the many essential details of the business, and fails in his undertaking and declares there is no money in it, or that soil or climate are unsuited, while, in the majority of cases, the real cause of failure was the man.

The capital employed may not have been sufficient for the area cultivated; the soil may not have been put into condition for producing a paying crop; fertilizatior may have been inadequate, or cultivation improper or insufficient—or, it may be that the gardener was of the opinion that his successful culture of general farm crops in the past insured his successful culture of potatoees and onions in the future. Though a truck farmer be well equipped for the undertaking, he is fortunate if he pays the expenses of the first year's operations.

The lack of appreciation of the advantages of our soil and climate, and ignorance of the requirements and hardiness of common plants, deprive many homes of fresh fall and winter vegetables. That a number of our most common vegetables will withstand our winter climate all over California and even repeated freezing is not generally understood, and the consequence is that no efiort is made to grow them. We may grow many garden crops throughout all seasons, and radishes, may, in many sections, be sown with profit each month in the year.—Home Seeker and Investor.

POTATO BLIGHT.

Worse than the Colorado beetle is the late blight. All things considered this is the worst enemy of the potato grower.

There is much discussion about treatment for cure and prevention. If nothing is done, the result is very discouraging. A flourishing, promising crop may be smitten in a day, and the yield reduced one-half.

Experiments at the various State stations and by progressive growers in other places, all indicate a great benefit from the Bordeaux spray. It cannot yet be said to completely control and eradicate the disease, but it certainly lessens its ravages. It is possible that further experience with some improvements in preparation and use will result in more real success.

LONG SERVICE

FARM WAGONS

THE wagon that breaks down and has to go to the repair shop every once in a while is not a good wagon to buy.

Such a wagon is a poor one because it is poorly constructed, and because it is made from poor and improperly seasoned material. It is dear at any price.

In the building of Weber and Columbus wagons there is always a rigid observance of these four indispensable requisites:

1. Proper wood materials,
2. Thorough seasoning,
3. Superior ironing,
4. The best of skilled workmanship.

These are the things which have built up the excellent reputation everywhere enjoyed by

Weber and Columbus Wagons.

The New Bettendorf Wagon has steel gears which make it a wagon for any climate, and practically unbreakable.

Strength and durability should be first considerations when you buy a wagon. The Weber, Columbus and New Bettendorf wagons can be relied upon for long, satisfactory service. They are built to haul heavy loads and to stand the rough usage to which farm wagons are always subjected.

These wagons are in the front rank of high-grade wagons.

With all the strength and durability of these wagons, they are not made excessively heavy. They are noted for their light running qualities.

International local agents will be glad to show you these superior wagons and furnish catalogs with all desired information. Call and take the matter up with them or write to nearest branch house.

SPRING AT THE RANCH.

SPRING once more is here in its fullest beauty. The winter slipped away gently and in a day came the surprise of the freshness of spring. The almond trees burst out into a snowy cloud, we held our breath at the renewal of the miracle of beauty, then the plums and now the peaches are making the orchard full of gay pink blossoms. The sweetness of budding life and of new turned earth is everywhere. The plows move down the rows of the orchards and vineyards followed by the black birds that eagerly search the newly turned soil for insects. The old daddy bird wears his clerical suit of shining black proudly; very like a minister he looks, while the meek little wife follows behind in a shabby suit of rusty black to carry out the illusion.

Spring in California is glorified by the wild flowers daintily growing amongst the bright green grass. The wild flowers are passing rapidly. They will soon be only a legend in the great valley of the San Joaquin. The constant cultivation of the orchards and vineyards are driving them away from the better lands and only in obscure nooks and corners are they to be found in their unrivaled lovliness. The unplowed lands of the vineyards and orchards are gay at present with poppies and cowslip, the survivors of the wild flowers that still remain, of the myriads that used to adorn the ranch in the bridal beauty of the springtime.

Alfilaria.

The cows are rejoicing in the alfilaria and in the rich high flavored young foxtail. These two grasses are particularly appetizing after the long time on alfalfa. I have had cows that made 16 pounds of butter a week on 'filaria. The alflilaria seems to be a wild plant that does not do well in cultivation. Foxtail, like the poor, thrives everywhere that man's hand touches the soil. When a plant has this great persistency it is worthy of systematic cultivation. The foxtail needs only to be civilized into laying aside its offensive weapons of barbs to make it very valuable as a winter feeding plant. The breeding out of these barbs would be a small matter compared with some of Mr. Burbank's work, for if the foxtails are carefully examined it will be found that many seeds do not have the sharp barbs. These plants are, of course, constantly supressed by the more protected seeds from increasing rapidly. The seeds from plants growing on rich soil are not nearly as sharply armored as those from the poorer soils.

Green Feed.

The problem that confronts the dairyman is of providing a green crop of feed for the cows in the late fall and early winter without a silo; this can be done with a fair degree of success. Rye should be sown on some of the lighter poorer land, the land laying above the irrigation ditches will answer very well as the crop depends on the winter rains to mature. On the ranch one seeding gives us three crops, as it will volunteer twice from one sowing. The rye starts to growing with t rains; as soon as it is six incl the cows can be turned into couple of hours daily. Tak off as soon as they stop gra tramping will waste the feed a couple of months of pa the rye is allowed to grow mature. When the fall co pigs are turned in on it to when it is all tramped down can be run over it or it can be left alone if the soil is of nature. There is only one tion necessary in grazing rye is, stop when it blooms. forms in the grains often if th son is at all damp. Ergot good for any breeding stock must be looked out for car How early ergot is formed, I d know, but have been told it start with the bloom forming kernel of the grain grows. is often fed to the cows, but makers are prejudiced against ing to the twang it sometime parts to the milk.

Alfalfa Fields.

The alfalfa fields are sav longer usefulness by not pas them during the rainy season tramping of the cows on the land compacts the soil and re it unable to absorb the rain. Th falfa fields should be disked an without stock on them during rainy time. If the land has heavily pastured try putting hundred to a thousand pound gypsum on each acre. Put the sum on in the fall before the rains, then disc in February and the thin spots. Cut the first crops on a re-sowed alfalfa field keep the cows in the corrals the roots are strong. The con tramping of cows is mischievo a careful man can save the bringing the cows in as soon begin to lie down to ruminate. nal tramping is an excellent make a turnpike, but a poor keep the alfalfa field growing ly.

Corn Fields.

The present seasonable work preparing the land for Indian The land is plowed with the ton gang plow and then har and then plowed with the plows going two inches deeper the gang plows. The harrow again run over the land to ma more compact after the stirring. furrows for the corn are run the land and then the plow coming back in the same fu The corn is planted three or grains every three or four feet like to soak the corn over nigh have it moist so it will start growth at once. The placing of the deep in the furrow has two fe to recommend it. The corn tected from cold winds when it sprouts and then later the roo deeper in the ground than if it wa sown on the even surface. th corn grows the cultivation graduall fills the furrows until the land comparatively level. When the corn is about three feet high, a furrow made between every other row an the corn well irrigated and then cultivated. Again, when the corn is in tassel the furrows are run on the alternate rows from the first irrigation well watered, once more cultivated and then left to grow until harvested.

JUST PUBLISHED.

A valuable book "Production and Handling of Clean Milk," by Kenelm Winslow, M. D., M. D. V., B. A. S., of the Veterinary School of Harvard University, the author of several veterinary books, has just reached the review table and we find it one of the most valuable books for dairymen who would produce clean milk, which we have seen. It is complete, plain, practical and authoritative guide to the production and distribution of clean milk for farmers, health officers, milk inspectors, students of agriculture and dairying, country gentlemen, physicians and others interested in matters pertaining to dairying and hygiene.

While the work is scientific or exact, it is written essentially for the intelligent layman. The writer has had perhaps unusual facilities for studying all sides of his subject, being a practicing physician, a graduate of a medical, veterinary and agricultural school, and he has had practical experience with animals and with the production and distribution of certified milk, and he has also been an official in charge of a laboratory having supervision over the milk supply of a large city.

In the preface of the book we note: "When the public is sufficiently aroused to the evils of consuming unclean milk and evinces willingness to pay for clean milk, there will be no difficulty about its production. It is merely a question of supply and demand.

"It is not generally known that the farmer sometimes receives but one-quarter of the retail price of milk (frequently but two cents a quart) and he can hardlly be expected to undertake a considerably increased expenditure for the production of clean milk—this being the case.

"There is probably more interest being shown in this and other countries in a pure milk supply than ever before. For this reason it should be a comparatively easy task for any individual desiring to produce clean milk in any considerable community to find a sufficient patronage, particularly if the local medical profession is asked to assist, always providing that the proper standard is constantly and conscientiously maintained. The idea of financial return must be subordinated to this, and yet a reasonable profit can and must be had to sustain the required standard.

"The aim of this book is to provide a working guide for those pursuing or wishing to pursue one of the most wholesome and laudable undertakings—the production of clean milk."

In the book are nine chapters and a valuable appendix with plans of barns, milk houses, general outlines and a scheme for the control, supervision and inspection of milk supply. The nine chapters treat on "Germs in Their Relation to Milk;" "Composition of Milk and Cream and Their Products;" "Milk Products;" "Feeding for Milk;" "Housing and Care of Cows;" "Handling of Milk and Cream;" "Cost of Producing and Distributing Clean Milk;" "Some Hints Concerning Milk Distribution" and "Milk Inspection."

From the chapter "Feeding for Milk" we quote: "In feeding cows for milk, the most essential fact to grasp is that the composition of milk cannot be altered to any extent by feeding. The solids may be increased slightly by a food very rich in protein, or, on the other hand, the solids may be lessened, if her diet

The 1908 Improved
DE LAVAL
CREAM SEPARATORS
are ten years ahead of all others in every feature of separator construction

Ten New Styles Ten New Capacities
Ten New Prices

A size for every dairy, from the smallest to the largest

Beautiful in Design
Perfect in Construction
Everlasting in Daily Use

The result of thirty years' experience in building separators. See the Improved DE LAVAL before you buy, or you must surely regret it later on. Send for handsome new catalogue of 1908 machines to be had for the asking.

The article on previous page headed "Just Published," is continued on page 370.

MOTOR POWER ON THE FARM.

Rev. J. D. Detrich is credited in the American Agriculturist with having kept 26 head of cows, two horses and several pigs on 15 acres of land.

The way he succeeded in doing this, he says, was primarily by using machinery, never allowing a man to do anything which a horse or machine can do. He sold the 15-acre farm and bought a larger one, and on this new farm put his labor saving theory into full play. He has an electric power installed on the farm and has a motor to cut all the hay, fodder, straw, etc., which is used. The motor is also used to unload the hay from the wagons and put it into the mows. He uses something which he calls slings on the wagons, two of them holding a load for a two-horse wagon. When driven into the barn, the motor is connected with a set of pulleys and ropes which take up first one sling and unload it and then the other, so that the whole load is taken from the wagon at two trips of the carrier and in almost as short a time as it takes to describe it the whole load is in the mows.

The advantage claimed for this motor is the saving it effects in labor, and in these days of scarcity of manual labor and high wages, everything which will cut down the price of raising crops is to be carefully considered by the farmer.

In the San Joaquin valley recently we saw in machine is designed to do the work of a steam operation a machine called a "farmobile." This plow, or rather, of a traction engine, which can be used for plowing, harrowing, seeding, etc. Such engines are so heavy that they cannot be used on some farms to advantage because they will not run on soft ground without sinking in too deep. Attempts to adopt the automobile to plowing have not been very successful because the wheels would not grip the soil enough to pull the plows unless the machine was made too heavy for other purposes. In the farmobile this has been remedied by having the car pulled by a cable which passes around a drum on the car and is wound around other drums at each end of the field, which are operated by a four-cylinder gasoline engine. Although the machine only weighs about 2500 pounds, yet owing to the unique method of propulsion, it is capable of pulling two gang plows which can turn over twenty acres a day, and will also seed and harow it at the same time. All machinery of this character makes it possible for the farmer to cultivate larger tracts of land with much less help than was the case formerly.

PASSING OF THE MEADOW LARK.

There is well grounded fear that the best known song bird in California, with the possible exception of the mocking bird, will soon be extinct. Somehow an impression has gotten out among the farmers, that he devestates crops. This is a serious mistake. Instead of being an enemy to the farmer he is one of the most valued of his friends. Last winter an effort was made by certain members of the legislature to remove this popular bird from the protected list on the ground before mentioned. However, the mere mention of such a thing showed how popular the bird is, for a cry of consternation at the very idea went up over the whole State, and he still remains upon the protected list. Our members of the legislature have not always shown judgment in regard to the protection of our birds, but it is to be hoped that they will never make so serious a mistake as to remove the Western meadow lark from State protection. It would be a mistake dearly paid for, since these birds are among our most beneficial ones. Farmers' Bulletin No. 4 written by F. E. L. Beal., assistant ornithologist, Biological Survey, sent out by the United States Department of Agriculture, has to say of this bird: "The meadow lark is almost wholly beneficial although a few complaints have been made that it pulls sprouting grain, and one farmer claims it eats clover seed. As a rule, however, it is looked upon with favor and is not disturbed. In the 238 stomachs examined, animal food (practically all insects constituted 73 per cent of the contents, and vegetable matter 27 per cent. As would naturally be supposed, the insects were ground species, such as beetles, bugs, grasshoppers and caterpillars, with a few flies, wasps and spiders. A number of stomachs were taken from birds that had been killed when the ground was covered with snow, but still they contained a large percentage of insects, showing the birds' skill in finding proper food under adverse circumstances." Again: "Briefly stated, more than half of the meadow lark's food consists of harmful insects; its vegetable food is composed either of noxious weeds or waste grain, and the remainder is made up of useful beetles or neutral insects and spiders. There is one danger to which the meadow lark is exposed. As its flesh is highly esteemed, the bird is often shot for the table, but it is entitled to all possible protection, and to slaughter it for gain is the least profitable way to utilize a valuable species."

We would here call the attention of all lovers of California song birds to the importance of looking after the welware of the meadow lark with renewed vigilance. Killing this bird for its flesh is quite common and it should be stopped. At the rate the bird is diminishing but a few years will elapse before it will cease to exist. Anyone who would kill a meadow lark for its flesh ought to be punished by arrest and heavy fine. The attention of the Audubon Society and all lovers of our song birds is directed to the protection of this popular and beneficial song bird.

the rains to cease, but do your spraying betw showers.

Celery and Onions.

Mr. Murdock urged as an important feat celery growing the securing of good seed. oughly prepare the ground, always in moist tricts, and never let the ground dry out. K free from weeds and cut back when about weeks old to make a strong stock. Plant a four feet apart in order to be able to cult thoroughly.

When Mr. Murdock reached the part in his dress referring to onion culture, he drew from pocket a copy of the California Cultivator, told the audience that in this paper was speech. He recapitulated what he had writte the Cultivator on onion growing and advised t interested to send for the copy containing his ticle.

Plant Lice.

Always interesting when discussing entomol cal topics, Prof. Woodworth was especially h in his treatment of Plant Lice. His time principally taken with a description of the ha of the destructive cabbage aphis. This. pest easily killed by spraying, but it needs immed treatment. When cabbage is not at hand, the p feeds on mustard and wild radish. Spraying w the garden hose will kill it, soapsuds will dest it, but spraying must be done when it first a pears.

Prof. Woodworth recommended: first to pr vent by destroying the things the aphis fee upon, which he mentioned as mustard and wi radish. Second to spray with any well-kn plant louse exterminator like kerosene emuls Prof. Woodruff presented as an object lesson, fro which to demonstrate, a plaster cast of the c bage aphis magnified 100,000,000 times. It wa frightfully uncanny object to look upon, but had the effect of causing his audience to "th the Lord" that it preys on vegetable life and on human bodies. After describing the char teristics of this aphis, Prof. Woodworth proceed in his lecture to urge a certain course of proce ure to rid plants of this destroyer. In brief th were, (1) prevent, by removing out of the way the aphis any plant it feeds upon. And (2) stroy the insect by thorough spraying.

In concluding the lecture it was urged that ery grower should be prepared to defend the of his plants by having at all times the mean command to extrminate their enemies. control demands coöperation of all growers keeping the fields clear of mustard, wild rad any other substance the insect feeds upon. ciations should secure inspectors and when prised of the appearance of the aphis, should s on a moment's notice. Damage comes in wai not by treatment of the plants.

Prof. Ralph Smith.

The experiment station, what it is doing the State agriculturally, and what the State ou to do for it; the efficiency of the Whittier tion under Prof. Smith, and what he has ac plished in the brief period he has been in ch was discussed by the editor of the Cultivator, Hon. P. F. Cogswell, the latter speaking most i terestingly. Prof. Wickson also responded calls, and, in a strong address, pointed out usefulness of the experiment station and the agricultural farm at Davisville, and what the may reasonably anticipate from these agencie future.

Continued on Page 368.

The date for the State convention at Riverside has been definitely settled after one or two changes, and will be held on the original dates. April 28, 29, 30 and May 1. One of the best program ever presented at such convention is, promised. The Cultivator has a letter from a fruit grower 600 miles north of Riverside, in which he says he will be present.

gricultural Notes of the Pacific Coast

Northern California

hico has a good roads campaign

he date set for the Santa Rosa carnival is May 15th and 16th.

he Haywood pickle factory uses ,000 pounds of cabbage weekly for rkraut.

armers near Gridley will plant gely of cucumbers for the Hayward kle factory.

he Asti Italian Swiss colony is reasing its vineyard plantings by acres this year.

roville contemplates an election the question of $80,000 bonds for structing levees.

ne gardener will plant over 200 es of potatoes, cabbage and tomas near Yuba City.

an Rafael is taking steps to prot the deer which inhabit the slopes Mount Tamalpais.

The growing of barley has practilly driven the wheat industry out the Sacramento valley.

A preliminary survey of the Sacraento river as far north as the eather has been ordered.

Trees are being planted along the vees near Marysville to make them ronger against the floods.

The cannery at Santa Rosa has en receiving many carloads of cans ady for the coming season.

Fruit growers at Winters have filed ticles of incorporation of the Wins Fruit Growers' Association.

The precipitation at Yuba City to te amounts to 13.45 inches. Last ar for the entire season, 21.34.

A vast number of resistant vines e being planted for experimental rposes on the Davis State Farm.

Northern California has a strong mmittee at Washington to urge e passage of the Newlands Bill.

Oroville is having a pure milk gitation and some dairymen are rotesting at the over-strict regulaions.

Hops have been sold in the Sacramento valley in the last few weeks at ess than half the cost of actual proluction.

A big reclamation project is uner way which will bring under culivation a large tract of land below he city of Marysville.

Many farmers at Ukiah contemplate plowing up their hop yards and establishing a cannery for putting up asparagus, tomatoes and beans.

The Department of Agriculture is distributing several small sacks of cotton seed to growers near Biggs, and it will be used for experimental plantings.

The Sonoma County Hop Growers' Association has adopted resolutions opposing the prohibition movement on the ground that it will injure the hop business.

Sutter county fruit growers are making an energetic fight against the pear blight, and the county Horticultural Commission has adopted resolutions requiring all orchardists to prune closely.

Percy T. Morgan, of the California Wine Makers' Association, is appealing that there should be no tax or license imposed upon the juice of the grape any more than there is upon the juice of the apple.

Central California

Large plantings of Valencias are being made at Lindsay.

Lindsay has had a rainfall slightly in excess of 10 inches.

An aged Chinaman near Exeter is producing an "odorless" onion.

A fine flowing artesian well was recently struck at San Jacinto.

Central California reports that extremely warm weather prevailed last week.

Prof. Wickson recently made an inspection of the Tulare Experiment Station.

One orchardist at Lindsay will put in 100 acres of citrus fruit, largely Valencias.

Many sections of Tulare and Fresno counties are hoping for a better road system.

Oakwood farm, near Los Gatos, has been purchased by Odd Fellows for a $200,000 home.

Watsonville is ornamenting the school grounds with a number of trees and plants.

The Health Board of San Jose is so active that an occasional dairyman loses his license.

Between 1500 and 2000 acres of orange groves have been planted this season at Lindsay.

A number of Los Angeles moneyed people are investigating Lindsay fruit prospects with the idea of investing.

The grangers of San Jose have endorsed the Highway Bill which is now before the National Congress.

The Pioneer Eucalyptus Company have filed articles of incorporation with the county clerk of Stanislaus county.

Winter grown peas from the Redbanks section near Porterville command 15 cents per pound in San Francisco.

The fine weather with the moist ground of the orchards, has made busy times for the orchardists of Valley View.

The total number of cars oranges from Lindsay during 1906 was 755, while this year up to the present there have been 840.

Raisin growers of Tulare and Fresno counties are pooling their holdover crops hoping to realize better prices than are now offered.

Spreckles Sugar Company has conceded many points demanded by the farmers, and many about San Juan will plant extensively this season.

Business men of San Jose are after the State Forestry Commission with hot shot. Personal appeals have been made to President Roosevelt, and every possible step taken to stop the destruction of trees.

Entomologist Morris of Santa Clara county is urging the establishing of an annual bird day. The idea is to create sentiment in favor of the birds which are doing so much to help the farmer in eradicating insect pests.

The Tulare County Horticultural Commission reports: "We find very little scale in either deciduous or citrus orchards; in fact we have but one place left to fight and that is in the towns on trees in yards. This we hope to wipe out this coming summer."

Southern California

The beet crop of peatlands is promising exceptionally well.

Tobacco growing has proved successful in the Perris valley.

Some early shipments of Coachella asparagus realized $1.00 per pound.

Imperial valley claims an output of $1,170,500 worth of products in 1906.

Eight thousand men will be needed to harvest the cantaloupe crop of Imperial valley.

Savage cattle on the range attacked a man at Lancaster and nearly killed him last week.

Five cents a pound is promised for the early shipments of onions from Coachella valley.

The grapefruit is proving more popular with orchardists of Southern California than formerly.

Imperial farmers are experimenting with the machine for setting plants, such as cabbage, tomatoes, etc.

Celery growers have proved conclusively this season that spraying is an effective remedy for the blight.

The Santa Ana Register says that there will be a liberal extension of the field of celery culture this season.

A great farmers' institute was held at Whittier last week, at which time the Pathological Laboratory was dedicated.

Bee inspector Quincy of San Diego county has asked for deputies to assist him in exterminating foul brood, which has become prevalent.

"The Jim Mills Circus" is the name given to some new wagons which have just been constructed at Riverside for the hauling of oranges.

The January pool of the San Bernardino County Fruit Exchange is showing more favorable returns to the growers than at first anticipated.

The California Fruit Growers' Exchange has opened an extensive advertising campaign thus far having centered their energies on the State of Iowa.

With over 200 or more cars daily, orange shippers are appealing for a little more caution in dumping too great a quantity at a time on the market.

The acreage of chilis in Orange county will be greatly reduced this year. The prices have not been entirely satisfactory to growers for the last two years.

County Horticultural Commissioner Pease of San Bernardino county reports that persistent efforts have been made to smuggle trees and vines into that county from infested districts.

The Imperial valley has been somewhat concerned over the introduction of grape vines from other sections without proper inspection, and one prominent party has been arrested.

The improved methods of packing oranges at Riverside have attracted the attention of the Eastern markets in a way that will compel all packing of oranges to be done more carefully in the future.

The annual meeting of the Santa Paula Walnut Growers' Association was held recently and the following officers and directors elected: G. W. Faulkner, president; J. H. Orcutt, vice-president; C. Thorpe, secretary; C. J. Cleveland, F. E. Good.

The Coast

Castle Rock, Washington, is to have a new cannery.

At least a million fruit trees have been planted in Yakima this year.

Farmers of Colorado are complaining of shortage of farm hands.

Over 1,000 colonists entered the city of Spokane within 24 hours on March 9th.

California orange market at Portland, Oregon, is very firm for good stock.

The wheat fields of Condon, Washington, are covered with six inches of snow.

Stock has been subscribed for a co-operative cannery at Independence, Oregon.

Floods near Portland, Oregon, have done much damage in many fruit sections.

Large quantities of hops have been exported from Portland within the last two weeks.

The State Grange of Oregon will meet at Eugene the second Tuesday in May.

Coos county, Oregon, is expecting the early establishment of a milk condensing plant.

Idaho legislature is contemplating irrigation systems which will cover 2,000,000 acres of arid land.

Wonderful development is being given to Pecos valley in New Mexico.

Many sheep and goats have been killed by worthless dogs in Linn county, Oregon.

The Oregon crop of onions is practically exhausted, and Japanese product is being imported for shipment to Alaska.

Much interest is created over the southern part of Oregon by the suit against the Harriman lines for valuable lands covered with timber.

Lane county, Washington, fruit growers recently held a most interesting session, at which the coming season's work of the association was discussed.

The hop market does not seem to be so much in the dumps as a few months ago, in Oregon, as a few buyers have appeared and taken up some of the surplus.

Goat shearing is in full swing in the Willamette Valley. The usual methods of disposing of the hair will be at auction in pools made up of the various producers:

Spokane will observe Arbor Day on April 18th. It is estimated that on that day there will be between 40,000 and 45,000 men, women and school children planting trees.

Farmers in Colorado are declining to sign contracts with beet growers, claiming they are so unjust that it is impossible to grow beets under the various restrictions.

Farmers at Queen Creek in the vicinity of Mesa, Arizona, have formed a company to construct a new reservoir which will irrigate thousands of acres of dry land.

Colorado beet growers are making emphatic protest against the price which sugar manufacturers have agreed to pay and are now making a demand for a flat $5.00 per ton rate.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Yar

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

TIME IS MONEY.

We need a year to grow a pig,
'Tis two before a steer is big,
The hens lay every day.

Alfalfa takes three years to spread,
A horse as colt four years we feed.
The hens lay every day.

A field of grain just once we reap,
A yearly fleece take off our sheep,
The hen lays every day.

A few weeks yield the honey store,
Then blossom, fruit and all are o'er.
Then hens lay every day.

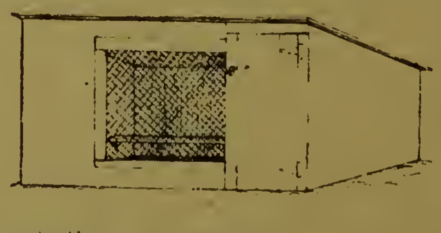
For other things, too long we wait,
Our life is short, and pay day late.
The hens lay every day.
—Farming World.

WEANING CHICKS.

AS WE said in our last article, the first few weeks is the critical time for chicks. But we do not want to give the impression that we can leave chicks to shift for themselves after they are four or five weeks old. The first three weeks in the chick's life may be considered the critical period, and we have heard people say that if they get their chicks through the first three weeks they could raise them to maturity. Yet we have seen flocks of chicks that grew finely until they were weaned, then they seemed to stop growing. The main reason for this is often lack of heat; while chicks are with the hens or in the brooder there is not much danger of lack of heat, but where the hen weans hem or they are placed in the cold brooder, we must make sure they don't suffer for want of heat. With the climate of the Pacific Coast at this season they may not need any artificial heat after the hen has weaned them, but they should have a nice, warm, comfortable coop to roost in.

Coops for Chicks after They are Weaned.

Most everyone has some special design for coop, which perhaps are as good or better than any we can suggest. The main thing to be remembered in coop construction is to make one that is secure when closed at night. Many prefer to let their chicks roost in open coops with no protection from rats, cats and other varmints. We believe that it will pay to put a wire front in coops for protection. The wire may cover part or the whole of front of coop. The illustration given here is of what we consider one of the best coops for growing chicks. It can be built with or without bottom. One thing to be considered in any style of coop, that the air space is much less in a coop than in a house, therefore, one should be careful not to crowd.



Dimensions and Capacity.

A coop to hold 25 chicks should be about five feet long, three feet wide and three feet high in front and about two feet at back. As the chicks near maturity they should have larger quarters, or flocks divided, as 25 adult birds are far too many for a coop this size.

Of course, it is not absolutely n essary to have such coops, as a box or barrel can be used, but oft these coops will save enough to for themselves the first year.

Teaching the Chicks to Roost.

This is one of the difficult pro lems with many, but we were ne troubled much in getting our chic to take to the perch. But they shou be watched that they don't crowd i to a corner. If good, wide roos are used, say a board six inches 10 inches wide for roosts there is n much danger that they will learn roost too young. A good method teaching them to roost is a slat bo tom to our coop. If that is use they cannot crowd and will natura ly take to roost, which should b placed only about four inches to si inches above slats, where they ha learned to get on perch; the slat bottom can be removed and used in another coop.

Feed and Forage.

Chicks after weaned should be fed much the same as before; they should have a variety of grain which can be fed in hoppers or i troughs. They should never get very hungry. If we have range o alfalfa to turn them on part of the day, they will do much better. I winter eggs are wanted keep the chicks growing, as the birds that mature early, as a rule, are the ones to start to lay first.

AROUND THE YARDS.

Get your chicks out early.

* * *

Milk is good for growing stock.

* * *

Many a brood of fine chicks has been sacraficed by neglect.

* * *

Broilers shrink about one-half pound each when dressed.

* * *

Don't neglect a sick bird; prompt attention will often keep diseas from spreading in the flock.

* * *

One man being asked how he fed to grow such fine chickens and get so many eggs, said he had no set rul but gave the fowls a little of everything they like.

* * *

Grit is the chickens' teeth. Goo mastication means good digestion, good digestion means perfect assimilation of food. All poultry, to thrive, must have this.

* * *

"Oh, give us the old-time hen!"
Wailed the wheezy minstrel man.
And a cherub up in the gallery cried,
As he tossed an egg with a chick inside,
"We'll give you as old as we can."

* * *

Barnyard Rooster (meeting a stray little chick): "Well, my son, what is the matter?"

"I'm an orphan."

"An orphan?"

"Yes, our incubator just burned up."

* * *

through summer; hay now is eight inches in length. Alfalfa can be put up and why not this hay.—W. C. D.

We have never had any experience in curing barley and wheat hay as you speak of, but we see no reason why it could not be done. We have taken clover and lawn clippings and cured it and when we were ready to feed it we would cut it up and pour warm water over same. This would give it a flavor almost the same as fresh clippings. But whether or not this would work the same with wheat and barley, we are unable to say. But we would like to have you try same and send the Cultivator the results, as we know many of our readers will be interested.

* * *

Feather Eating.

Is there any reliable cure for confirmed feather eating hens. These pick each other's feathers until they are quite bare. If there is anything that will cure the habit, it will be a great help to us. The Cultivator is indispensable.—Mrs. O., Escondido.

Feather pulling is generally caused by improper food and birds being too closely confined. If you feed a narrow ration, and don't feed animal matter, your birds will crave animal food and often this will lead to feather eating. Again we have known wet or feather lice to cause trouble; they irritate the bird which causes them to pick at feathers until habit is formed.

We don't know of the remedy you mention, but if you will get a bottle of chloro-naptholeum and spray your birds using one part water to one of chloro-naptholeum, we think you will have no further trouble. After spraying or dipping we would change feed. Either feeding in a litter or feeding a well balanced ration with plenty of animal food, you will have no further trouble.

* * *

Dirty Eggs.

Will you please let me know through your Cultivator whether duck eggs will hatch as well when you wash them off, as if not washed off? They get them so dirty laying them around the muddy water.—A Cultivator Reader, Lodi.

We would not wash duck eggs if they only had dirt on them, as dirt is porous. The eggs can be wiped off with a dry cloth. However, if the eggs have anything on them that is gummy, or if an egg has been broken on them, we would wash it off as broken egg fills up the pores which will prevent the egg from hatching.

THE EFFICACY OF DUST BATHS.

The natural way by which fowls cleanse their bodies and keep them free from lice and mites is by means of dust baths. In providing these baths, it is well to bear in mind the specific points which prompt their use. While exercise is an important thing provided by the baths, the main good they do is to relieve the birds from lice and mites, which would otherwise make their lives miserable. The birds roll and scratch and fluff their feathers until the fine dust is thoroughly worked through their plumage and down to the skin. The insects referred to breathe through pores in their bodies and the fine particles of dust close these up and the vermin die.

It will be seen, therefore, that the dust bath must be composed of very fine dust to be effective. The dryer and finer it is the better the fowls will like it and the more good it will do them. Some people mix fine screened coal or wood ashes with road dust and think that the combination is better than either one alone. A little tobacco dust mixed with the thing, aids in exterminating vermin.—Agricultural Epitomist.

Feed the Chicks and Kill the Gophers

West Coast Chick Feed

A full, rightly balanced ration for the little ones, to be fed dry. All pure feed, no filler, no waste. The biggest seller because the best made. Keeps them growing and healthy. For sale by many dealers; if not by yours send direct to us.

Bille's Gopher Poison

is most attractive to gophers, squirrels, etc., but sure death. Endorsed by Agricultural Colleges and Experiment Stations. Has had the greatest success for years in the Middle West, and also here in California last season. Circular with many testimonials and Affidavit of 201 killed in one day. If your dealer hasn't it, send $2.50 for two bottles, (not less than two) express prepaid by us. Money refunded if not as represented—so printed on the bottle.

Barred Plymouth Rocks
Ocean Blue Strain
D. T. Wieland, Moneta, Originator

This strain has been bred in line by me for 19 years and never defeated in the show room. For 16 years our pullets have never lost first prize. At the big Chutes' show 1908, we won first and second pullet in a class of thirty, nothing else shown. Eggs $2.00, $3.00 and $5.00 per 15; incubator lots at $8.00 per 100. Eggs now testing fine. We have purchased the best son of the first Chicago pullet, 1907, to head one of our pens. A first prize cockerel heads our cockerel breeding pen. Other pens the same breeding and good ones.

Take short line car at 2nd and Spring Sts., via Gardena; get off at Illinois at Moneta. Right on Ranch.

Starbuck's Barred Plymouth Rocks

We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are laying fine. We have divided into pens according to the way they are showing up in six months laying. $2.50 for 13 eggs from first pen. $1.00 from 2nd. until they have time to make longer records. (Except from our one best, not for sale. We claim the world's Barred Rock, 6 months laying record for this one.) Do you wish to hear about our prize winning Buff Orpingtons and Silver Wyandottes? We have something to crow about. No Sunday sales or visitors. *Wm. Starbuck & Son. Fullerton*

Investigate! That's all I ask. Get the best while you are at it.

You will succeed with the "Success"

BABY CHICKS

Buy Day Old Thoroughbred Chicks

The easiest and quickest way to get a start in the poultry business. You can get just the number you desire and at the time you are ready. No delay waiting for the hen or incubator to hatch and no uncertainty as to the number of eggs that will hatch—for mishaps will often occur that spoil your hatch even when almost ready to come off.

When you buy Baby Chicks, you select your breed, order the number you can care for, heat your Brooder, and you are right in the chicken business with both feet. Of course, it goes without saying that your Brooder must be constructed along correct lines—for upon the evenness of your Brooder's heat greatly depends the result. Brooders poorly made where the chicks have a tendency to "pile up" in order to keep near the proper temperature, cannot raise a full percentage of chicks, no matter how carefully hatched or how strong they may be. If your Brooder is right, you should raise 95 per cent of all chicks you start with.

We guarantee every chick we sell to be a thoroughbred, to be healthy, from a well-established strain, and we do not allow a cripple to go out.

We make a specialty of shipments to distant points. They can be sent safely up to 1000 miles and rarely do any die on the journey.

Our prices are $15.00 per 100 on all standard breeds, except White Leghorns, which are $10.00 per 100. We can sell in smaller numbers if you wish.

One order placed with us will prove to you that we "deliver the goods."

We sell Incubators, Brooders, Choice Seed and Poultry Supplies.

FARMERS SHOULD TEST THEIR SEED CORN.

During the past two months, members of the Experiment Station have made a study of the seed corn of the State and find the vitality of much of it to be in a serious condition. The unusual cold, wet season of 1907 did not allow the corn to mature and dry out before the time of frosts. In the early part of October, much of the corn of the State was still in a very moist and immature condition and the series of hard freezes which came at that time materially injured the vitality. The result of these conditions is that those corn growers who depended on late selected seed, are now finding upon close examination many ears of questionable vitality. For these reasons all seed corn should be specially selected and thoroughly tested. A test of each individual ear should be made and all weak or dead ears should be discarded.

This test can be made in several ways. The following is suggested as a reliable and satisfactory one:

Take a box made of inch lumber and of any convenient size, say about two by three feet and three inches deep. Through the ends and sides, about two and one-half inches from the bottom, bore small holes two inches apart. Through these holes string a light galvanized wire, which will divide the box into squares two inches to the side. Then fill the box with garden soil or sand and it is ready for use. The ears should be laid on the floor or racks in a row so they can be numbered. From ear No. 1 remove five kernels, each from a different part of the ear, and place these in square No. 1, remove five kernels from ear No. 2 and place in square No. 2, and so on, until all the ears have been tested. After placing the kernels, moisten the material in the box thoroughly and cover with a glass or a rug, to keep the surface from drying. Place the tester in a room of ordinary living-room temperature, or about 70 degrees Fahrenheit. After five days examine the corn, and any ears that fail to show a strong germination of the kernels, should be removed and discarded.

This method of testing corn is simple, convenient and rapid, and means much in securing strong, germinable seed. Only fourteen ears are required to plant an acre of ground. With an average yield each ear means five bushels in the fall. When a man can test five to eight bushels in a day and locate definitely all weak or bad ears, can he afford to neglect this important step in the preparation of his seed corn?—G. I. Christie, Purdue Experiment Station.

LOGAN BERRIES.

CORN WORM.

This pest takes cotton South and tomatoes in th Wherever sweet corn is gro are apt to find this wor called the "corn worm." Du summer, after the worm has full grown, it crawls out of drops to the ground, and sta during the winter in a li which it makes. The next s changes into a moth, which l on corn, cotton or tomatoes, case may be. Fall plowing only practical remedy, as means you break up the which the worms are hibe Should the plot of sweet co small, and you can not conve practice fall plowing, you c stroy the worms by hand. T ways start their work at the end of the ear, so that by o the husks a short distance you can discover the worm if present. If it is, feed the co cattle, or mash the worm. worm is infesting cotton or toes, pick them off and destro

Its habits of very general is among the difficulties exp in attempting its contr plants upon which the lar have been known to feed about 70. The principal crop United States depredated upo this species are cotton, corn, toes, tobacco and various g crops.

Various names have been a to this insect, according to th plant or character of inju flicted; the names "bud- "corn-ear worm," "tomato worm," etc., being various plied. The term "sharpshoote ing very loosely used, is quit applied to it. The exclusive u the term "bollworm" should b couraged to prevent confusi gardless of the food plant which the insect is found.

PRODUCTS "MADE IN CALIFO NIA".

Plague.

ve a stock ranch in the Im- valley and devote much of my o hogs. This spring I have not very successful with my pigs the ages of six weeks to three ıs old. Out of one lot of 180 I lost more than 50 per cent. were weaned from six weeks to ıonths old and turned out in a here I have a large stack of l barley. They did well for a time and then commenced to I have found as many as seven in one morniug. They were nd plump and very active. I ht the trouble was due to hog o I soon got rid of that pest, hat did not diminish the usual er of deaths. Thinking they had disease, I dipped them in a on of permangulate of potash, hat was not effective. Lately I been examining them internally find large intestine very much ued and ridged, having the ap- nce of proud flesh on the out- the inside is coated with a ance that looks like cheese about ighth of an inch thick. Before die they turn purple on the belly legs. They frequently have eyes and a hacking cough. They m live longer than 24 hours after show the first symptoms. e that appear to be strongest and st frequently die in 24 hours. do not get thin and poor, nor hey get diarrhea.—A Subscriber, ley.

think your pigs have what the au of Animal Industry have ed as "Swine Plague," a dis- very similar to "Hog Cholera;" in fact, they may have both diseases at the same time. A few years ago there was a great discussion among pathologists as to there being any difference, some holding that it was all cholera, but Dr. Salmon who was chief of the Bureau at that time segregated the germs and produced the diseases entirely separate.

In order to post yourself thoroughly on the subject, write the Bureau of Animal Industry, Washington, D. C., asking them to send you special reports on "Hog Cholera" and "Swine Plague" and should advise you to call in your "County Stock Inspectors" to make a thorough examination of the conditions. But since the resignation of your late incumbent there is no one there competent to make a scientific examination. The disease is very contagious, the healthy pigs should all be moved to new pens not less than one hundred feet from the old ones, using none of the old material without thorough disinfection. All dead should be burned or buried deeply, and all litter burned. Be very careful about the water as the germs will be carried in the ditches.

POULTRY ON THE FARM.

In the discussion following a lecture on "Poultry," a gentleman in the audience gave some interesting statistics on the cost of keeping chickens on the farm and on the profits to be made from a well managed flock of farm poultry.

One dollar is the amount usually allowed as the cost of feed for one chicken for one year. But this gentelman stated that he had been keeping a careful record of his feed bill for several years and said that he was able to maintain his flock of 200 Plymouth Rock chickens at a cost of not more than 65 cents each, charging for all the feed they consumed at the same rate as he could have received from dealers. Of course the actual cost of production was much less than what he allowed. He found that after deducting the cost of feed, he had from $1.50 to $2 left each year as the clear profit on each hen. He said that this paid him very excellent wages for the time he spent with the fowls—so much so, in fact, that he is seriously thinking of enlarging his poultry operations.

Another farmer poultryman I was talking with a few days ago figured out his profits on a little different basis. Instead of estimating the extra high wages he has been getting for his poultry work, he figured out how much above the market price his chickens paid him for the food they consumed. He feeds his laying hens mostly wheat and finds that the hens pay him at the rate of something like $2 a bushel for all they eat.

These two cases are not exceptional cases at all; any farmer can do just as well or better if he is willing to keep good chickens and give them good care. Of course, there are flocks of farm poultry that are not by any means paying their keep; we are perfectly willing to admit that, because it is proof that poultry on the farm is unprofitable. What it does prove is that good chickens and good care are superir to scrub chickens and scrub care. To which class do you belong—that is the question.

There are a number of reasons why the farm naturally is more favorable to the profitable raising of poultry than any other place. A few of the most important ones are: The farmer can produce on his own farm all the food required by his fowls and at a much smaller cost than the same food could be bought elsewhere; he can utilize much food that otherwise would be of little value or would even go to waste; he can give his fowls free range during a great part of the year and thus materially lessen the feed bill.—Agricultural Epitomist.

LABORATORY INSTITUTE.

Continued from Page 362.

Wednesday morning opened with rather better attendance than the first day and the walnut men seemed to show greater interest than the vegetable growers. The first feature was a short address by Conductor Neff who referred to his experience in grafting trees at his own orchard. Mr. Neff has done the first grafting in Southern California in any large quantity. His orchard has been a very profitable one, but amongst the trees are many which have failed to bear either through the fact that they were shy bearers, or worse, that some were affected with the blight. Of these indifferent trees this year grafted about 80 trees. This work was done by an expert brought from the northern part of the State who has done much grafting there. At the time the work was done the invitation was extended to walnut growers of Southern California to visit his orchards and witness the operation. On first page is a photograph showing the manner in which the work is done, also a part of Mr. Neff's remarks at the Institute on Wednesday morning.

Prof. Smith.

Prof. Smith followed with a few remarks in which he urged the using, in planting orchards in the future, of only resistant trees grafted on California blight or hybrid stock. He said:

The industry is on the eve of revolution. The idea of obtaining any treatment which will be a remedy for blight has been given up and progressive growers are turning their attention to solving the question otherwise and believe it can be brought about in new plants of resistant qualities. He advised growers to go slow in planting new orchards and take time for selecting the trees. The old trees have not proved satisfactory, and the sentiment is fast gaining favor that the coming tree of Southern California will be native black walnut root, grafted with French varieties which by their habits of growth are immune from blight. Many improved varieties were also exhibited by Prof. Smith.

Walnut growing in France was treated by A. H. Dunlap of Whittier. Mr. Dunlap has been in the walnut growing section of France and gave most interesting points about marketing and culture in that country.

Semi-Tropic Fruits.

At the afternoon session Mr. C. P. Taft gave quite an extended account of tropical and semi-tropical fruits which have been tested in California, some of which have proven remarkably successful. Mr. Taft's work has been principally with the loquat of which the Advance and Premier seem to be his favorite. The greatest objection to the loquat industry is the blight which is fully as deadly as is the pear blight. Other tested fruits were the Avocado or Alligator pear, of which he said there were at least 100 trees in Southern California.

The Cherimoya or Custard apple, lemon guava, Sapota, Mangoes and other fruits which are yet in the testing stage and but little definite information as to their worth in Southern California.

Immune Varieties.

Prof. Ramsey made a strong point in his talk on immune varieties, he said that with all the plant the past several years which has ly increased acreage, the Cali output had continually dec This may be overcome in pa thorough cultivation and irrig abundance of fertilizer and i gent care at all times. But th vation of the industry will come the planting of only grafted from resistant stock. He pre the root stock the Californi or hybrid nut. He said in tim will be no more planting of s than there is now the plant seedling apple or orange. He the illustration of various p grafting some of which are p of on first cover page of this The period of grafting ext through the months of Feb March and April, and another will show which particular tim be the more favorite, as a vast ber of experiments are being this year.

For grafting wax Prof. Ran prefers the following:

Five pounds rosin, one pound wax; one pint linseed oil, with tle flour or lamp black to give The station force has prefer flour and Mr. Neff has prefe lamp black.

Mr. Koethen's paper appears o other page of this issue of the vator.

Wickson on Burbank.

The evening session opened w short address by Pres. Thomas lin of Whittier College, in whi made many comparisons bet the work of the Whittier Patho cal Laboratory and with schools and the public schools of country. It is all pathological a he urged that to cure the disea the human mind we should wor is urged in working with trees plants. That we use prev nt rather than curative measures

Prof. Wickson followed with short talk about Luther Burba k, i lustrating with many photograp the experiment grounds at the S Rosa and Sebastopol station of Burbank. Prof. Wickson sho proper appreciation for the which Mr. Burbank has done, carefully avoided any reference the so-called wizard power w many newspapers have seen fi accredit to Mr. Burbank. He that one of the greatest b from Mr. Burbank's work was i fact that it was encouraging observing people to open their e to some of the things which may accomplished in our work w plants.

Laboratory Day.

Thursday morning was given o entirely to inspection of the labr tory and excursion in the vicinity o Whittier. The laboratory is sit near the center of the town a ing more like a large residence t a State institution. Its interior, however, is planned for good, pr tical work, and is fitted with work benches, sinks, laboratory rooms, incubator rooms, together with microscopes and other delicate instruments for solving the various problems which come before the institution. Back of the building is a plat of ground where tomatoes, cabbage and other plants are being grown for use in experimental work.

At the opening of the session in the

erred to one experiment in re-
; the "strength" of the onion
id that many more onions will be consumed were it not for the one disagreeable factor that it was very "savory." It should be made just savory enough to wear to meetin'. When that was accomplished he declared we would have a glorified onion.

Filcher.

J. A. Filcher, secretary of the State Board of Trade, was present and made an address in lieu of Gov. Gillett, who was unable to attend.

The Banquet.

The banquet given in the evening was well attended and a royal good time enjoyed by all.

Citrus Day.

Friday's program which was entirely citrus, called the largest attendance of outside-of-town delegates. The delegations from Riverside, Pomona and Covina were very large and even Ventura county was represented. Local people also drove in until the church in which the sessions were held was thoroughly filled. One of the most interesting features was that of the exhibit room, where the commercial pack of many of Southern California's best packing-houses were shown. This was supposed to be, as each house sends out under its brands, but one or two boxes of lemons were plainly put up for exhibition purposes rather than a regular commercial pack. Other than these exceptions the exhibit was very instructive as to the manner of packing in the different houses.

Tulare County.

The institute opened in the morning with a paper by Mr. A. G. Schulz, who gave a very able presentation of the manner of handling orange groves of Tulare county. This paper will be given more fully in a later issue of the Cultivator.

Gum Disease.

As Mr. Schulz had referred in his paper to the fact that their trees were on heavy 'dobe soil and were often effected by "foot rot," quite a discussion followed on that question. Prof. Smith said that there were many different forms, or at least three, of this disease. The one which effects the Tulare county orchards is generally the true mal-di-goma. This is a constitutional disease brought about by soil conditions, and its cure is brought about by correcting those conditions. At Porterville it has often been secured by excavating the hard ground immediately around the tree and filling in with gravel or sand. The trees are then treated by cleaning or scraping away the diseased gum and covering with a grafting wax consisting of four parts rosin, two beeswax and one part mutton tallow. This is not a curative in any sense, but is a treatment simply given, as would be the case where bark was injured by the plow or in any other manner. Prof. Smith recommended emphatically that trees planted on heavy or moist soils should be budded on sour Florida stock.

Tribute to Smith.

J. A. Reed, of Semi-Tropic Fruit Exchange, Los Angeles, gave tribute to the work of the pathological laboratory and to Prof. Smith in particular for his work with the brown rot and the advantage it had given to the lemon men of California. For this work he gave the hearty thanks of the fruit grower and hoped that the investigations of the brown spot which Prof. Smith is now looking into would

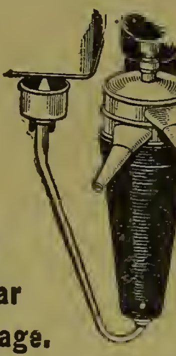
YOU'VE SEEN A CROWD

in a doorway, when people were all coming out, getting along easily, everybody pleasant, the tide moving right along together.

You've seen the same sort of doorway when the outs were trying to get in and the ins were trying to get out—everybody confused, uncomfortable, cross, and no progress.

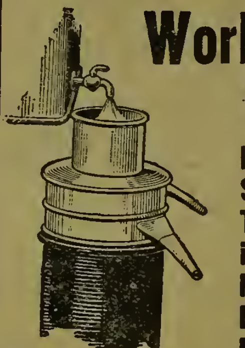
The first doorway represents the Tubular bowl bottom—the milk flowing from the supply tube, in a smooth current, directly into the separation process, rising smoothly through the bowl, all going the same way to the discharge pipes.

The second doorway represents the milk at the bottom of a top-feed "bucket-bowl" separator—at the bottom of all "bucket-bowl" separators. The supply of milk coming down from the top has to stop, reverse its current from down to up, and start into the separation process in conflict with what was previously in the bowl.



The TUBULAR WORKS WITH ITSELF

By Reason of Bottom Feed The Milk Entering a Tubular Bowl Has Unobstructed Passage.



Working AGAINST Themselves

Is What All "Bucket Bowl" Separators Are Doing, Through Top Feed of Milk into the Bowl --- Inflowing Milk Meets Ostruction at Bowl Bottom and Its Flow Must Be Reversed.

THE TUBULAR WORKS SMOOTHLY

The milk current starts upward without interruption, separation begins instantly and is uninterrupted in any way within the bowl, and the cream is discharged smooth and unfrothed. The milk supply works WITH the Tubular.

In "bucket bowls" the milk stops and starts, is somewhat frothed before separation begins, is further chopped and churned, by plates, discs, cones, wings and other bowl contents and can neither be well separated nor smooth. The top supply WORKS AGAINST the "bucket bowl.'

This is one of the "reasons why" the Tubular skimming is cleaner than other separators will do, and far easier turning and the splendid butter that comes from unchurned, unwhipped, frothless, velvety cream.

Write for Catalogue No. 260 a new edition since January 1st, which tells the scientific and mechanical reasons for Tubular Superiority.

Continued from Page 361

is very watery, but the percentage of fat, sugar and proteids in the milk is not affected to any degree by different kinds of food stuffs. One often reads of the marked influence of a change of food in increasing, or otherwise, the percentage of fat in the milk. But, while a sudden change in the ration may produce a corresponding alteration in the percentage of fat in the milk, it will be found only a temporary matter. The single exception to the rule that the composition of milk is not changed by feeding, is when the animals are not in a normal condition. If an animal has not enough food to be maintained in a normal condition there may be a disturbance of the functions of the udder, as of any other function in the body, and, therefore, alteration in the composition of the milk.

"Notwithstanding the fact that the composition of milk can be materially altered by feeding under ordinary circumstances, yet by good feeding and breeding (taking advantage of increased fat yield in milk through careful selection,) it has been found possible in several generations to produce an animal giving milk one per cent richer than that common to its breed. This has been accomplished by some in th the Holsteins.

"Wolff's original feeding for milk cows, per day pounds live weight, is as

Digestible protein ....
Digestible fat ....
Digestible carbohydrates ...

ROSES.

FOR SALE—ROSES, FIELD GROWN AND grafted; two-year-old plants. Will sell in large lots at a bargain before potting them. H. L. BAUER & SONS, 737 S. Spring St., Los Angeles, Cal.

MARKETING.

A practical knowledge of marketing on the part of the housewife affects both the comfort and the expenses of the whole family. Intelligence and skill in buying are needed, but they are only secured by thought and careful practice. The purchaser must not be afraid to ask questions, as most men with whom she will have to deal will be patient, helpful and reliable.

It is usually to one's advantage to select a regular place for marketing. Greater consideration is shown such customers and better results are obtained.

It is a good plan to order for more than one day at a time. If you have consideration for those from whom you are buying by ordering groceries or meat in ample season, so there is sufficient time to fill the orders, you will find your orders will be sent to you on time. Too many housewives plan so little beyond immediate needs; oftentimes they leave the ordering of a roast until about ten minutes before it should be in the oven.

The telephone should never be used regularly in place of frequent visits to the market. Orders given to the order man have not proved so satisfactory as the visits to the store. Greater variety is secured by seeing many unthought of articles; also a closer economy.

Strong emphasis has frequently been placed upon the fact that "the best for the purpose is always the cheapest." One writes, "In buying meats as much nourishment and as palatable food, if well cooked, can be obtained from cheap cuts as from choice ones. In carpets or rugs, excellent wear and more service is secured from some not of the highest price. On the other hand, it pays to buy the best in many lines of groceries, for the best means the purest, least adulterated."—Mary J. Brush, Assistant, Department of Domestic Science, Colorado Agricultural College.

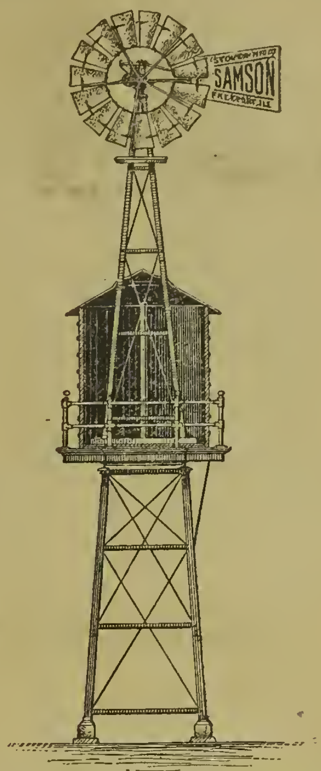
PREFERS CAUSTIC BALSAM TO OTHER PREPARATIONS.

Please send us your pictures of "famous horses." We have a good sale on Gombault's Caustic Balsam and it gives good satisfaction. People come back for it and take it in preference to similar preparations at one-third the price.—Homestead Pharmacy, Homesteal, Ia.

The State college farm at Pullman, Washington, has about 100 head of hogs, consisting of Poland-Chinas, Berkshires, and Duroc Jerseys.

SAMSON WIND MILLS

Have double gears, removable bearings and center lift, which double the life of the mill. They will last longer, pump more water and give better satisfaction than any other WIND MILL.



This is an up-to-date Sub-structure, Tank and Wind Mill outfit complete; substantial, economical and attractive. We build all kinds. Write us or our general agents for full information and prices, description &c., before purchasing.

Great Bargain in Fine Land

The Big Field Ranch in Kern County is being colonized and is now on sale at the low price of $25 per acre, 1-4 cash.

It lies in the heart of activity in the San Joaquin Valley, a broad area of perfectly level land, consisting of rich sediment.

This land has an inexhaustible supply of artesian water, and is fully equal in productiveness to any land in California, regardless of price.

Suitable for grapes, alfalfa, peaches, grain, sugar beets, dairying, etc.

Unquestionably the greatest snap in high class land ever offered in the State. Excursions leave Los Angeles every few days. Call or write for maps, booklets and full information. Do not delay. Do not locate anywhere without seeing this magnificent property.

7000 acres have been sold to practical farmers. 5000 acres will be under cultivation this season.

Percy H. Clark Co.
311-312 H. W. Hellman Bldg.
Los Angeles, Cal.

A bitter fight is on between two sugar companies at Grand Junction, Colorado, where both parties are endeavoring to secure contracts for the next season. This should be agreeable to beet growers.

Oregon apple growers have taken up a line of advertising by "sun printing" on their bright colored apples by placing the advertising matter over the fruit with perforations while it is growing and coloring.

LITTLE FOLK LAND.

Let's go a-seeking for Little Folk Land,
Where I went straying a long time ago.
Hey, little wayfarer, give me your hand,
And lead to a vale that I once used to know;
For there were more wonders than later years see,
Fairies and elves in the dawnlight at play;
And, "Let's return thither," my heart whispers me,
But, oh, I've forgotten, forgotten the way.

Ah, there are secrets in Little Folk Land,
Riddles that only the babies may guess;
Not even a mama can quite understand
Glory of paths that the tiny feet press;
Beautiful castles in wonderful dells,
Caverns, gnome-haunted, a-glitter with light,
Music that's tinkled from fairyland bells—
And it's, oh, to go back to that country tonight!

Ho, little traveler, I've gone astray,
Losing the way from the Now to the Then;
Give me a finger and lead me away
Unto the Little Folk Country again.
All of the wealth of the Valley of Now
Is but alloy to the riches you konw—
Hey, little chap, with a smile on your brow,
Lead me again to the long, long ago.

—A. J. Waterhouse.

HOW HEROES PROPOSE.

PROBABLY in all the billions of proposals that have gladdened the earth since Adam's day no two have been precisely alike. Every man has his own way of asking the woman he loves the momentous question, and every woman has her own way of answering.

Fiction writers have realized this, and it is amusing to note the way the heroes of popular novels lead the love making up to the point of "popping the question."

No stranger proposal is to be found in fiction than that of the "old sea dog Solomon Sprent," in "Micah Clarke," by Sir A. Conan Doyle.

Solomon, having scarce put foot on land for nigh forty years, can, as a consequence, only speak in the sea jargon. He insists that Micah shall come with him on his momentous errand as consort, "and stand to and fro in the offing." He also arranges for the flagship (himself) to let her consort (Micah) know if the enemy hauls down her colors, by hoisting "a white jack at the porthole."

As it proved, the sailor had no great difficulty with his suit, and soon managed to capture his prize. Here is his own account of how he popped the question:

"Having read her the articles of war, I explained to her the conditions under which we were to sail in company on life's voyage—namely:

"First—She to obey signals without question as soon as received.

"Second—She to steer by my reckoning.

"Third—She to stand by me as true consort in foul weather, battle or shipwreck.

"Fourth—She to run under my guns if assailed by picaroons, privateers or garda costas.

"Fifth—Me to keep her
pair, drydock her at int
see that she hath her a
coats of paint, streamers
ing as befits a saucy plea

"Sixth—Me to take no
in tow, and if any be no
to cut their hawsers.

"Seventh—Me to revictu
by day.

"Eighth—Should she
spring a leak, or to be bl
beam ends by the wind
tune, to stand by her a
pumped out or righted.

"Ninth—To fly the Prot
sign at the peak during lif
and to lay our course for
harbor, in the hope that
and ground to swing may
for two British-built craft
up for eternity.

" 'Twas close on eight be
these articles were sig
sealed."

But it is not always the s
has to do all the wooing;
the damsel meets him
half way, as did Phillis
Lane Allen's "Two Kent
tlemen." This is how P
won by her Baptist lover:

"Hit wuz long time," he
" 'fo' Phillis come to heah

"I 'ain't out'n no watter yit,' s
she, very contemptuous.

" 'When does you consider yo'
out'n de watter?' says I, ve'y h
ble.

'When I get dese soakin' clo'es ı my back,' says she.

Hit wuz good dark when we got ıe, en atter a while I crope up to doah o' Phillis' cabin en put my down to de key hole, en I see llis jes settin' 'fo' def balzin' s dressed up in 'er new red linsey ss, en' 'er eyes shinin'. Den I tap y on de doah, en say en a mighty mblin' tone, says I:

'Is you out'n de water yit, Phi-?'

'I got on my dry dress,' says she.

'Does you 'member what you had d back yon'er in de watter, Phil-?' says I.

'De latch string is on de outside doah,' says she, mighty sof'.

'En I walked in."

here was no beating about the h when Sam'l Dickie proposed to owhead's Bell, as related by J. M. rrie in his inimitable "Auld Licht lls." The following is an idged account of the famous race m kirk to homestead between m'l and Sanders, resulting in the tory of the former, and his light-ıg proposal, which also is de-ibed:

or two years it had been notori-s that Sam'l Dickie was thinking courting T'nowhead's Bell, and ıt Sanders Elshioner might prove formidable rival.

he courting reached its crisis one bbath.

The first half of the service had en gone through. It was at the d of the psalm which preceded the mon that Sanders who sat near door, lowered his head, and in ıt attitude slipped out of the ırch. Sam'l, from his seat in the lery, saw Sanders disappear. With true lover's instinct he under-od it all. Bell was alone at the m. What an opportunity to work e's way up to a proposal! San-rs, doubtless, was off to propose, d he, Sam'l was left behind.

am'l rose to his feet in a daze. He tered past his parents, hurried up aisle, and was gone.

t was a race for a wife, and sev-ıl onlookers in the gallery braved e minister's displeasure to see who n. The chances were in Sanders' vor. The rivals had seen each her! It was now a hot race. Sam'l ıd it! No, Sanders was in front! me of the congregation perspired.

Sam'l was just in time to cut San-rs out, though sadly blown. San-rs took in the situation and gave at once. When he arrived at his stination he did not go in. He ent to have a look at the pig.

"Lord preserve 's! Are ye no' at ıe kirk?" cried Bell, nearly drop-ng the baby as Sam'l broke into ıe room.

"Bell!" cried Sam'l.

Then T'nowhead's Bell knew that r hour had come.

"Sam'l, she faltered.

"Will ye hae 's, Bell?" demanded am'l, glaring at her sheepishlly.

"Ay," answered Bell.

Sam'l fell into a chair.

"Bring 's a drink o' water, Bell," e said.

* * *

In Charles Read's "Love Me Lit-le, Love Me Long," we have a little ve scene conducted on good old-ıshioned lines. David Dodd, the evout lover, is on his knees:

"What are you doing, Mr. Dodd?" avid arose from his original posi-ion, and, being a young man whose impulse always was to tell the simple truth, replied: "I was kissing the place where you stood so long." He did not feel that he had done anything extraordinary, so he gave her this information composedly; but her face was scarlet in an instant, and he, seeing that, began to blush, too. For once, Lucy's tact was baffled; she did not know what on earth to say, and she stood blushing like a girl of 15. Then she tried to turn it off.

"Mr. Dodd, how can you be so ridiculous?" said she, affecting humorous disdain. But David was not to be put down; he was launched.

"I am not ridiculous for loving and worshiping you, for you are worthy of even more love than any human heart can hold."

"O, hush, Mr. Dodd! I must not hear this."

"Miss Lucy, I can't keep it any longer—you must, you shall hear me. You can despise my love if you will, but you shall know it before you reject it."

"Mr. Dodd, you have every right to be heard, but let me pursuade you not to insist. O, why did I come back?"

"The first moment I saw you, Miss Lucy, it was a new life to me, I never looked twice at any girl before. It is not your beauty only—Oh, no; it is your goodness—goodness such as I never thought was to be found on earth. Don't turn your head from me; I know my defects; could I look on you and not see them? My manners are blunt and rude—O, how different from yours—but you could soon make me a fine gentleman, I love you so."—Sacramento Union.

Cultivating Cherry Sprouts for Canes and Umbrella Sticks, Vienna, Austria. Courtesy S. L. Allen & Co., Philadelphia.

HOMELY HINTS.

Apple, potato and most other stains can be removed from the hands by rubbing them with oat meal mixed with lemon juice or vinegar. When the stain is quite removed wash with warm water and soap.

An excellent home remedy for a persistent nervous cough at night, is to wring a piece of flannel out of very hot water, sprinkle a few drops of turpentine on it, and put it round the throat, covering it with a dry cloth to retain heat and moisture.

Water brash is a symptom of a sour stomach. Twenty drops of aromatic spirits of ammonia in warm water, sipped slowly, will relieve the condition.

To Stir Smooth Thickening.

All housekeepers appreciate the difficulties of mixing perfectly smooth flour thickening or gravies. One of the best methods for success is to take a new wire dishcloth with a handle and keep it for a thickening stirer. Half a dozen whisks with this and your thickening is all mixed, much smoother than you could possibly do it with a spoon. Hold the stirer for a moment under the faucet, hang on the drier and it will require no more washings.

The Way to Saute.

To saute anything means to dress it quickly in a small pan with a very little butter, oil, lard or dripping, doing one side at a time.

Two spoonfuls of oil will be enough to saute a small chicken in. The art of sauteing well consists in doing it quickly to keep the gravy and succulence in the meat.

It is an economical mode of dressing some kinds of foods. It is very different from frying, which is really cooking in hot fat, and requires a much greater quantity of the oil, butter or fat for its performance.

Ingrowing Toe Nails.

Pain from an ingrowing toe nail can be very much relieved by cutting the nail straight across, or even hollowed in the center; place a whisp of cotton under the edge of the nail where it cuts the flesh, and wet with peroxide of hydrogen. If the nail is hard and stiff, file it down the center until it is very thin and pliable, as this relieves the pressure upon the sides.

HOW TO POLISH MISSION FURNITURE.

If mission furniture, with the dull finish, loses its smooth surface and characteristic waxy appearance, do not despair and send it to the renovator. Take a pound cake of common floor wax and rub it over the surface until the finish is restored. If you have no floor wax, use beeswax, and if you prefer something made especially for the purpose you can buy liquid preparations, one of which will remove the old finish, leaving the table top or other object ready for the application of the other substance, which will duplicate the original finish.

The sugar factory at Manzanola, Colorado, received over 140,000 tons of beets last year and produced over $2,000,000 worth of sugar.

AN ESSAY ON THE HORSE.

The following remarkable essay on the horse is said to be from the pen of an East Indian student: "The horse is a very noble quadruped, but when he is angry he will not do so. He is ridden on the spinal cord by the bridle, and sadly the driver places his foots on the stirrups and divides his lower limbs across the saddle and drives his animal to the meadow. He has four legs; two are on the front side and two are afterward. These are the weapons on which he runs. He also defends himself by extending these in the rear in a parallel direction toward his foe, but this he does only when he is in an aggravating mood. There is no animal like the horse. No sooner they see their guardian or master than they always cry for food, but it is always at the morning time. They have got tails, but not so long as the cow and such other animals."

SYMPATHY.

A plump little girl and a thin little bird
Were out in the meadow together.
"How cold that poor little bird must be
Without any clothes, like mine," said she,
"Although it is sunshiny weather."

"A nice little girl, is that," said he;
"But O, how cold she must be! For see,
She hasn't a single feather!"
So each shivered to think of the other poor thing,
Although it was sunshiny weather.
—M. Johnson.

The annual report of the Montana Stock Commission says that this has been a most favorable year for stockmen.

LABORATORY INSTITUTE.

Continued from Page 369.

be as completely successful as had his work with the rot.

For this tribute and expression Prof. Smith expressed deepest appreciation, but called attention to the fact that Charles C. Teague of Santa Paula had been the real originator of the work. Mr. Teague had first come to him with samples of the rot, and when he informed Mr. Teague of his inability to take up the work at once because of the lack of funds in the university, Mr. Teague promptly guaranteed the amount which might be necessary to take up the investigations and made good by advancing $1000 necessary.

Mr. Powell.

G. Harold Powell's paper, which was read by Mr. Eustace, was one of the features of the institute which commanded intense attention. Mr. Powell was present, but owing to trouble with his eyes, was unable to read. This paper is in the hands of the Cultivator and will be found on another page of this issue of the Cultivator. It is worth reading.

The interest of the citrus grower in the Pathological Laboratory by C. C. Teague of Santa Paula will appear in full in the Cultivator.

J. H. Reed of Riverside, in his address on "How May the Results of Scientific Investigation Be Most Effectively Applied in Practice," spoke of the long fight necessary in order to secure the establishment of this laboratory and the citrus experiment station at Riverside. For the laboratory he gave credit to Mr. Jeffrey as being one of the first to suggest it as being one of the needs of Southern California. As to the securing of the results for the ordinary farmer who is hard to reach and seldom attends these institutes we will refer more at length later.

A Valuable Session.

It was one of the most valuable institutes ever held in Southern California, and, unfortunately, excepting as many of its features will be published in newspapers, the benefit will be far less than it should be for the important mass of information as was there given. The Cultivator has picked out only a few of the good things which it will tell to its 12,000 readers, but the inspiration of hearing such practical men discuss questions of such vital importance was had by only the 150 to 300 people who attended. These institutes should be attended by such numbers that no building could be had large enough to contain the audience.

It was remarked during one of the sessions that the men who needed the inspiration of such a meeting were not there. The progressive and advanced thinkers among our fruit growers and farmers were there giving of their experience and inspiring each other to still greater effort to advance the industry which is the backbone of the nation. The point was several times made that no matter how choice a product might be grown or packed by the fruit grower, no matter how tasty and attractive the package, its price in the market must be always dragged down by the indifferent fruit often sent in by the progressive fruit grower's neighbor.

The educational campaign must be kept up and will be kept up until the general grade is much higher than at present and the indifferent and careless growers are crowded to the wall.

AN EVERYDAY CREED.

I believe in the efficacy of soap.

I believe that work is the best pancea for most ills, especially those of the mind, and that fresh air, exercise and sleep are the best medicines for the body.

I believe in fun and laughter, both as a tonic for the blues and as an outlet for high spirits.

I believe in the beauty of flowers, sunsets and mountains; in the music of birds and brooks.

I believe in human kindness.

I believe that an ounce of frankness and explanation is worth a pound of repentance and forgiveness, and will often prevent heartache and bitter understanding.

I believe in the hearty handshake, in hospitality, comradship, friendship, love.—Boston Brown Book.

BAILIE & BRANDT CO.

Announcement is made of a new combination in the machinery business. A new company has been incorporated under the name of Bailie & Brandt Co., to continue the business formerly conducted by Waite Bailie & Co. of Los Angeles. Mr. Bailie was the president and general manager of the latter company and has made gasoline engines his specialty and is thoroughly posted in all makes of same.

Mr. Brandt, for many years chief mechanical engineer of the Baker Iron Works, owing to his wide experience in machine design and installation, is peculiarly well fitted as a consulting engineer.

This company makes a specialty of buying, selling and exchanging machinery. Slightly used machinery is overhauled in their shop and thoroughly tested before placing on sale and is guaranteed the same as new machinery, although sold at a much lower price. This fills a long felt want in Southern California as many purchasers who formerly feared to buy any machine that had been used can now purchase from this reliable company, with the assurance of a square deal. Nothing but good machinery is handled.

Any one desiring gasoline engines, pumps, electric, mining, steam or other machinery will do well to consult this company before placing their order. Traction engines with gasoline motive power and other new machinery are also constructed, and any one can get more information by calling at 943 North Main Street, Los Angeles, where the office, salesroom and shops are located. Correspondence also receives prompt attention.

IMPROVEMENTS IN CREAM SEPARATORS.

From the very general satisfaction derived from the use of the better class Cream Separators for some years it has seemed that the separator had reached the point of practical perfection.

As a matter of fact, however, this wonderful implement, productive of so much profit and convenience to the dairy farmer, has from the very beginning, some twenty-five years ago, reached its remarkable development through constant evolution from one stage of capacity, completeness of separation, lightness of running, durability and general excellence into another, always quite in advance of the previous standard.

Hence it is a little less surprising than would otherwise be the case to note the many and novel changes found in the new 1908 De Laval machines, and still less so perhaps from the fact that the De Laval machines were first in the beginning and their makers have spared no effort or expense to maintain their position in the separator trade.

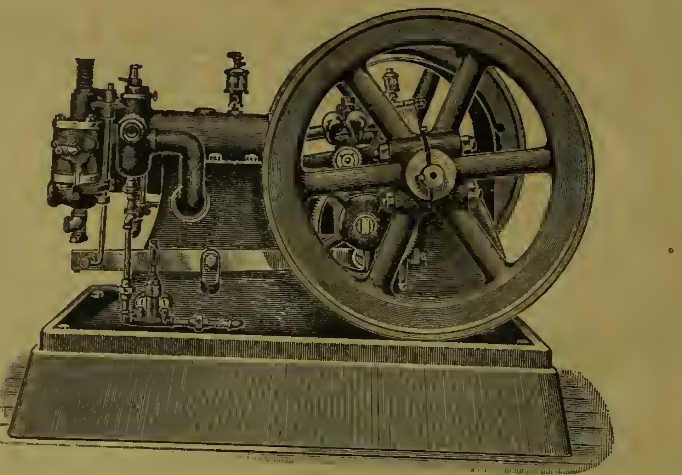
TO PLEASE THE LADIES.

Lady Customer—I wish to tell you how these shoes of mine are to be made.

Shoemaker—Oh, I know that well enough; large inside and small outside.—Philadelphia Inquirer.

Cramming is a system of artificially feeding young fowls, either by hand or machine, for the purpose of putting on extra flesh, three weeks being the usual course.

Alamo Engines



Gas Engines Like automobiles have been greatly improved in the last two or three years. When buying an engine don't buy an antiquated model. Buy an engine that embodies all the latest improvements. THE ALAMO is a modern distillate engine.

SEE OTHERS, BUT DON'T BUY UNTIL YOU'VE SEEN AN ALAMO. DROP US A CARD

Before He Bought a Tubula

This Man Used to Carry Half Ton of Butter to His Hogs Every Year

THAT'S what Mr. McKerrow did for twelve years previous to 1903. Then he bought a **Tubular.** When he discovered how wasteful he had been with cream, he says that he felt like "kicking himself." Listen to him:

Herkimer, New York.

Gentlemen:—Did you ever feel like kicking your own self? I have felt like that every time I think of what I have been throwing away for the last twelve years. **Six tons of butter carried to the hogs in that time!** I made 315 pounds per cow in 1904, deep setting; 368 pounds per cow in 1905, using Dairy Tubular. 53 pounds per cow for 20 cows makes 1060 pounds; this, at 28 cents, makes about $300.00. I guess the Tubular has paid for itself all right. Skim-milk worth double too.

Wm. McKerrow.

This is not an isolated case. Thousands of thankful families all over the globe are rejoicing in the possession of this profit-bringing, cream-saving machine. It seems like a friend ever after the first week. Even one day's lack of use makes the dairyman or farmer miss it **tremendously.**

Ten Things a Tubular Surely Does.

1—Runs daily for months and months without a hitch. One man writes that in three years he paid out 40 cents for repairs.

2—It skims so clean we guarantee it to leave only one-half of that left by any other machine.

3—It turns easily requiring one-half the power needed by other machines.

4—It will run one-half longer without clogging than any other machine.

5—It delivers one-half less froth in cream than any other separator.

6—Needs only a tablespoonful of oil twice a week.

7—It requires little attention from the operator because every part is thoroughly tested and inspected by experts at our factory before shipping.

8—It requires one-tenth the time in washing required by any other separator.

9—The receiving can is lowest of them all and most convenient to clean and adjust.

10—A Tubular causes you no worry, fuss or muss. It's just a tried and true workman that is always on time; always sober.

A Tubular Will Pay for Itself

We don't care where you live. If you own eight or ten cows you can use a Tubular and pay for it in cream saved in a year. Buy the easiest machine to fill, to turn, to wash. A separator that skims clean, needs next to no repairs and saves you fuss, worry and trouble. It would pay to sell one of the cows and buy a Tubular.

Putting in Milk

No high lifting, no slipping milk pail and lost profits with a Tubular. The waist-low can solves the problem. Skimming is fun for the whole family from the six year-old up. It is a pleasant anticipation because the exercise is not exhausting and the operation is without fatigue.

This is the way one man views the "high up" kind:

"Gentlemen:—To say that we are pleased with our Tubular is putting it mildly. We have used a disc-filled, bucket bowl for several years. We find that we have been losing quite a percentage of cream besides **'climbing up to the top of the house and pouring the milk down the chimney.'** For ease of operation, rapidity, and thoroughness of separation there is no comparison between the two."

Turning a Tubular

All working parts run in oil. Every part is adapted so perfectly to the other that once got in motion it's a joke to keep the bowl spinning.

The oil compartment cannot possibly leak nor at any time allow the oil to spatter on or contaminate cream or milk. The machine takes care of itself and does not worry anyone with clogged oil holes or leaking bearings. Thus your cream and butter are free from the remotest possibility of ever being rejected because of machine-grease, odor or suggestion of rancidity. This one feature saves you much worry.

Washing a Tubular

Only three pieces in the bowl to wash, all easily gotten at. Nothing to rake and scrape your knuckles nor skin your wrists and fingers.

One man who owns a "bucket bowl" machine allows it to stand idle in his dairy house That means $225 rusting! He uses a Tubular instead. Why? "Not for all the money in the Universe" says he "will I break my wife's back, ruffle her temper or spoil her digestion by requirin her to wash twice a day those 35 'pie plates' 365 days in the year."

Fill Out the Coupon

We have asked you questions which we suspect you are willing to answer. If you will fill out the coupon and forward to us we will see that you get just the treatment that will make you a lasting friend of ours. We shall not force ourselve upon you to make you feel unpleasant and under obligations. All we ask is for you to give the Tubular a reasonable trial along side of as many other separators as you wish, or alone. If it does not perform as we claim, you needn't keep it.

Application for More Information About a Tubular

..............................190....

The Sharples Separator Co.

Gentlemen:—I would like to know more about your Tubular Separators. In order that you may treat me intelligently I will answer the questions below which I deem proper.

1. How many cows do you milk?......
2. Have you a Separator?.... What style?......
3. Have you ever seen a Tubular skim?......
4. Are there any of your neighbors who use a Tubular?......
5. Is there a local agent near you who sells Tubulars?......
6. How far are you from a railroad station?...... What is its name?..................
7. Send me your catalog No. 260, and other free literature explaining all about the Tubular.

I understand that this coupon with my signature attached does not obligate me in any particular. I am filling out this coupon to obtain information about Tubular Separators.

alled to design the buildings.

great State of Australia decides to undertake an enterprise in water storage and distribution which may surpass the great Assonam enterprise upon the Nile, our university irrigationist was taken to plan it.

When the State Board of Health, under recent statutes, provided two State-wide institutions, a State Hygenic Laboratory and a State Food Laboratory, both were established in Berkeley so that our experts might direct their operations.

When the fruit growers of California are forced to protest against what seem to them unwarranted restrictions upon the use of sulphur in fruit curing, and the president of the United States appoints a referee board to ascertain the exact science of the matter, one of our physiological chemists is chosen.

These few instances of the recent choice of the University men to lead in such diverse lines of advanced work should establish the claim that the University is really at large in the State and fills a sphere of influence altogether beyond the reach of ordinary academic qualification.

Organization Favors Expansion.

The broad conception of University service which the foregoing public acts imply is earnestly held by those chosen to direct and adminster the affairs of the institution and seems to be foreordained by the plan of its organization. It consists of intergral subdivisions each devoted to a special line of human learning, original research, technical activity and industry. The instinct of self-preservation, if no higher motive, forces each subdivision to strive to the utmost to attain and retain the best standing and efficiency in its own subject. The Regents of the University are widely distributed geographically an are themselves active in many lines of profssional an industrial effort. Even those who are best known for professional services, as in law and medicine, for instance, are thoroughly conversant and actively engaged in industrial affairs, either through their own or their clients' property interests and enterprises. The Regents are, therefore, qualified experts in the lines which the institution pursues, all the wide way from finance to farming, and do constantly place the most exacting tests upon the quality of University service. The president of the University is a man of the widest human interests, a keen judge of scholaristic and industrial efficiency and most broad and fair in his appreciation of educational values in all the divisions of knowledge which he is called upon to correlate and advance.

Lines of Progress of the College of Agriculture.

I have said more perhaps than I am authorized to say for the University as a whole. I take safer ground now by special reference to the part of the institution which is entrusted to my direction. The Agricultural Department of the University is now advancing in accordance with two clearly related principles, viz:

1. Specialization of subjects and workers.
2. Distribution and localization of work.

The purpose in view is to do each desirable thing in the best place and with the best attainable men and equipment. In the diverse undertakings which this department must enter upon to fitly represent and serve the agriculture of the State, centralization, except in purpose and administration, is undesirable. Both for research and for experiment and for the best special instruction as well, the College of Agriculture must not be restricted to work at the University site. Close contact must be made at Berkeley with the biological and the economic sciences, for from these comes the new truth and the new impulse to agricultural advancement. From association with the other applied sciences, also, agriculture receives direct suggestion and material help. Therefore, for maintaining its own progressive character and the diginity and quality of its citizenship, the highest instruction in agriculture must be given at the fountain head of all higher learning establishments by the State—the University itself. This is in accordance with the principle of doing a thing in the best place to do it.

Local Branches Essential.

But the University must maintain centers for local research and instruction in representative places in all parts of the State where research can be best done and where there is opportunity to achieve beneficent results by instruction locally suitable. And this, too, is only a growth of the Agricultural Department along lines which constitute an approved University policy. The University studies stars from the top of Mount Hamilton, because that is the best place to see stars; it studies marine life in the waters of San Diego and Pacific Grove, because there such life best abounds; it studies law and medicine in San Francisco because there the multitude multiplies maladies and misdemeanors. To do everything that is worth doing in the best place to do it is, therefore, a principle which the University widely applies in its operations, and to do this it is always at home, though always at large in the State.

A striking instance of the pursuit of this policy by the Agricultural Department is to be found in the building and equipment of the Southern California Plant Disease Laboratory, which was formally opened last week in Whittier, Los Angeles county. By the liberality of the State we have secured in this laboratory a most unique establishment for plant sanitation and protection. It is probably the best establishment for this single and separate purpose in the country, and in connection with the citrus culture station at Riverside. constitutes an agency which through the work of its investigators in the best places for them to work, will return high profit to the State. In fact, tomato growers in Southern California freely say that a single demonstration already made for their benefit will be worth more to them in a year than the cost of the whole establishment. And it will do such profitable work continuously hereafter.

It would weary you to pursue in detail the activities of the Agricultural Department. The experiment station now has thirty-seven investigators at work at various points in the State and serving nearly all branches of our agriculture. The instruction in agricultural subjects at Berkeley is taken this year by about 140 regular and special students and about three times as many more who, though enrolled in other departments give part of their time to agriculture because they are allowed to choose for themselves under the elective system. Thus we are instructing in agriculture about 600 young Californians whose homes are in all parts of the State and who are constantly extending throughout the State a bet-

TREE TANGLEFOOT
A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

WALNUT TREES

Having about six thousand Walnut trees that have to be moved on account of close of lease, I will make special prices on them for the next thirty days. These trees are two and three-year-old Santa Barbara soft shell variety, stocky and well rooted, running from four to ten feet in height. Seed selected from one of the best orchards in Orange county. A rare opportunity to get good trees at right prices.

Deciduous Fruit Cu

FERTILIZERS FOR WALNUTS.

A FEW years ago there was a general movement far into the the interior valleys to plant walnut trees. Some land has been planted that is not particularly adapted to growing the walnut and some of the owners have been inquiring about fertilizers for walnuts, thinking that an application will set them on a par with the best walnut lands. It would be our advice not to plant walnuts on poor land, but if a good head of water can be run onto it, plant it to alfalfa. This will enrich the soil more cheaply than can be done by any other method. Deep sandy loam is an ideal soil for the walnut and if the climate is right and water is to be had in abundance such soil will produce walnuts for many years without the necessity of applying fertilizers.

Walnut trees are so deeply rooted that any fertilizer that will be available to them must be in a soluble form so as to be carried deep by irrigation and rain waters. Analysis, however, shows that the chief ingredient to be replaced is nitrogen. The nitrates are easily soluble, which makes their application an easy matter.

The fresh nuts without hulls contain about one per cent of nitrogen and about seventy-eight hundredths of one per cent. of ash, which means all the potash, phosphoric acid and other minerals that are taken up by the entire nut. The fresh kernels contain about two per cent. nitrogen and fifty-two hundredths of one per cent. of ash. The hulls which are returned to the soil contain about 1.75 per cent of ash and only .15 of one per cent. of nitrogen. This shows that nearly sixty per cent. of the minerals are used by the hulls which are returned to the soil.

When phosphates are present in the soil and humus is wanting, little benefit is derived from them. Nearly half of the available potash and phosphoric acid is found in the humus. The humic acids keep these ingredients in an available form, dissolving them out. The planting of legumes will furnish to a large extent the nitrogen necessary for the trees and nuts, and perhaps all that is needed. A light dressing of potash and superphosphates will, with the green manuring crops be all that is necessary to keep up the fertility necessary for this crop.

Walnut trees are particularly well adapted to growing green crops as they are deciduous and the plants have the full sunlight the entire winter. It is not possible to sow the green manure seed as early as in the case of orange groves unless the grower is willing to have the crop tramped during the picking of the nuts. This may work out in practice and be an economical way to proceed. It depends on how much the green stuff stands tramping on during the harvesting of the nuts. The plants will be sickly and weak as they must start in the shade if planted as early as September, and together with the tramping at harvest time the addition of a partial smothering when the leaves fall, there may be little to show for the labor and expense of early planting. These things, however, do not always work out according to theory and there may be considerable advantage in September planting.

At this season of th
quite apparent that the
nitrate of soda will giv

pruning, it is well to keep in
not to remove any more limbs
are absolutely necessary and to
, as much as possible, removing
large limbs. The larger the
removed the larger will be the
ds and the longer these will
to heal over. The healing of the wounds is done by the cambium layer, which is the active growing tissue of the plant cylinder, pushing itself over the scar mainly from the upper side. If the wound is small it will heal over during the growing season; if it is large it may take one or more years. The longer the wound remains exposed the more the wood will crack and dry out.

All the limbs should be cut off as close to the trunk or larger branches as possible. It is not infrequently seen where pruners leave stubs from half an inch to three or more inches in length projecting out. These stubs never heal over and should not be left. In some cases they may cause injury to the tree as they die back into the wood of the main branch. If the trees are headed-in always cut back close to a bud, for the reason that if a stub is left above the bud it will die back.

Dressing for wounds is some times necessary, especially for the larger ones. The dressing used ought to check the weathering of the wood and prevent any decay. A wound dressing should be durable. Paint and tar are very common materials, but lead paint is the best all-around dressing for common pruning wounds.

When to prune is another common question. There are a great many ideas in regard to the time to prune trees. Since the healing of the wound depends upon the activity of the cambium it would seem, other things being favorable, the quicker the healing begins the better it is for the tree. The healing goes on faster in the spring after the plant starts to grow. Taking into consideration the healing of the wounds and the activity of the cambium the better time to prune would be in the spring before growth begins, during February and March. This does not mean, however, that trees cannot be pruned in the winter. Trees may be pruned any time after the leaves fall off, but the earlier the pruning is done in the fall or winter the longer it will take the wounds to head over.—Fabian Garcia, New Mexico College of Agriculture.

ANALYSES OF FERTILIZERS FOR CONSUMERS.

Under the provisions of Section 4 of the State Fertilizer Act, any consumer of commercial fertilizers residing in California may have analyses made at the State University in return for a nominal fee for each analysis. This fee of $2 per sample examined does not begin to pay the actual cost, but is exacted to partially pay the running expenses of the Fertilizer Control and to insure that correspondents shall not send in unnecessary samples. To properly take advantage of this privilege, persons interested should be careful to take their samples in a way that shall make them representative of the entire lot of goods. If samples are not as taken the analysis will make it appear that the goods are either of greater or less value than they really are. In one case doing an injustice to the consumer, in the other to the manufacturer.

A letter to the Agricultural College will bring a blank with full instructions.

All broken or mutilated roots should have the ends pruned smoothly at time of setting.

SUGAR BEETS

Heaviest yields per acre and largest sugar contents are secured by the liberal use of

POTASH

It is essential that the fertilizer contain at least 10% Potash.

To Secure Best Results from Scientific Investigation

Address delivered at the Pathological Laboratory Institute.

BY J. H. REED OF RIVERSIDE.

Like many other things of great advantage to California, the Pathological Laboratory and Riverside Experiment Station may claim a father in Mr. Reed. He has always taken a working interest in founding such institutions. He not only "Fathers" them but he "Mothers" them. This address shows his interest in them and calls for all farmers getting full value from these establishments. It is well that the audience of a few hundred which listened to Mr. Reed shall be extended, and we hope the Cultivator's 12,000 papers make Mr. Reed's voice reach much farther.—Ed.

I WANT to be allowed a few words of preface. Probably no one present looked forward to this meeting, held for the purpose of celebrating the opening of the Southern Pathological Laboratory with more interest than I have done. It is now some eight years since a committee from a then somewhat active horticultural society in Riverside was appointed to formulate an effort to have established somewhere in Southern California a citrus experiment station, where the serious practical problems of orange growers might be tried out to the finish by systematic investigation, conducted by trained experts. It is a long story full of disappointments, but each succeeding year the importance of this help from the State was more deeply felt, and the effort in a quiet way was kept up till finally the object so long looked for came in sight.

It was about this time I called on my friend Mr. Jeffrey to talk over the project. After hearing me through, Mr. Jeffrey said: "That is all right, except it is a pathological laboratory rather than a 'field' experiment station that is most needed," and we had a little friendly quarrel over the matter, each of us looking at it from a different standpoint. This difference of opinion taken up somewhat warmly by adherents of each side was finally settled in the legislature.

So it is to Mr. Jeffrey that you people of Whittier and we farmers who needed it, owe the movement that has resulted in the establishment of the Pathological Laboratory.

Well, what I want to say is that I am sure each party to the controversy agrees that the outcome giving us the citrus experiment station inaugurated at Riverside a year ago and the Pathological Laboratory, formally opened here at Whittier yesterday, is far better than either had planned. So, while I greatly rejoice in this establishment of our Citrus Experiment station, from which I expect most important results to our great industry, I hail with real satisfaction the permanent housing and fine equipment of the pathological plant, from which I believe will come equally important, not only for the citrus industry, but to other important horticultural interests of Southern California.

Average Farmer Loses.

Now the question is, how are we to get the largest benefit from the considerable expenditure this State has made in establishing these institutions and providing for the expert work of the scientists connected with them. That larger aggregate results have come from both national and State agricultural investigations and experimental departments, no one intelligent in the matter questions. But no one conversant with the facts questions less the deplorable lack on the part of the average farmer of utilizing, except in a very general way, even the most practically valuable of these results. In most agricultural districts are a few enterprising farmers always alert for anything that promises improvement over present methods, and are quick to utilize them, while the majority cling to their old methods.

Powell Investigations.

Perhaps there has been no more striking illustrations of this fact than in Mr. Powell's investigations into the causes of decay in handling citrus fruits. While these investigations were exceptional in at once changing long standing methods of a few prominent orange growers and to a certain degree of influencing the industry generally at first the largest values from them were secured by a comparatively few. In spite of this fact that these investigations quickly and definitely showed that an orange injured from any cause was subject to decay before reaching the consumer. In spite of the object lesson before them of certain growers accepting this demonstrated fact were by utilizing it, making a clear saving by it alone, amounting from 25c to $1.00 per box, we saw a large majority of our growers persistently handling their fruit in the old way at a loss of hundreds of thousands of dollars annually.

Pathogolical Investigations.

I am not so conversant with results following successful investigations of our plant pathologists which have demonstrated how diseases may be prevented or cured, but I have been told by scientists who have worked, for instance, on the pear blights, that this disease, so fearfully devastating one of California's important industries could at least be controlled if growers generally would make use of preventions and remedies scientists have shown to be successful. That this is equally true in efforts of scientists to combat other diseases, I think is not questioned. In fighting our insect pests, did our orchardists generally and persistently use the information that scientists and practical experimenting have fully demonstrated, our battle would be speedily won.

The actual loss to our horticultural industries from the lack of generally utilizing fully demonstrated laws of cultural methods and soil fertility would be difficult to estimate. Hence how best to secure a more general utilization of valuable results of scientific investigation of our agricultural problems, becomes a most serious consideration.

Only Well Begun.

In this brief address I can but touch upon some of the ways which seem to me may be most helpful in securing this end. First, I am fully persuaded that the government's scientist's work is but half done when he has demonstrated that the results of his investigations may be practically valuable to the farmer if utilized. I remember very well when pleading for the citrus experiment

ince experience has amply that successful work, made through bulletins only, does ıre the results desired, except ited extent, but that when an d method has been found by c research, it must not only onstrated that it is an im- nt, but it must be put before ner and kept before him till the alert exception, but the d file are persuaded to make t. Till this is done the State tion do not receive adequate sation for their expensive ef- r the betterment of agricul- nce they reach but compara- few, and they of those who elp the least. And this fact g more and more appreciated.

tton Boll Weevil.

ı the boll weevil threatened ton industry a few years ago ientists were set to work to ans of staying its ravages, the gton department did not stop ing that a change of varieties hanged methods of culture largely accomplish the object, t once established little co- ve experimental farms, scat- over the affected districts, the results of its investigations emonstrated to the average grower, and the better meth- re quickly and generally ap- ith the result that a portend- astrophe to the greatest agri- l industry of our country was , as it could not have been scientific investigation alone.

the Ground.

ıave a valuable illustration of ciency of this supplemental tration of expert work in re- om Mr. Powell's investigations uses of orange decay. While to this work as Mr. Powell's, ot ignorant of, nor do I forget t that his able corps of assist- ıs had in it.

said that the great lawyer into office Gov. Hughes went when g man had a way of watching aduates of great law schools, ıen he found a specially bright man enlisted him in his

ice that Mr. Powell has a like of keeping in touch with our agricultural schools, and pick- the best men they turn out helpers. He could not have ıis work that is saving our in- a million dollars a year with- e expert help of these young

ng the opportunity of keeping hat in touch with the work ıe first, and quickly appreciat- e tremendous practical value ven in its early stages, I was ıat impatient to have the esults presented to growers. . Powell would say, "Wait; st be absolutely sure of our before any statements are ıt." Later, results were made through the press by bulletins, attracting considerable attention. But in spite of these reports plainly and definitely showing the enormous loss necessarily attending the ordinary manner of handling our fruit, and how it could be easily stopped, a bare handful of growers promptly profited by them, a large majority persisting in the old wasteful methods. Last season Mr. Powell began to call managers of associations and others at various orange growing centers together, putting to them in his forcible way the actual results of his investigations, and showing how they could be practically applied in the orchard, the packing house, and in transit. The effect of these face-to-face talks with illustrations was immediately felt, and enormous in results. During the last interim between seasons, scores of packing houses were largely or entirely remodeled. Extensive plants for precooling are being built, trained picking crews under intelligent supervision are now in many orchards, in place of cheap contract work by the box. In fact, the methods of harvesting and packing and transporting the orange product has been largely revolutionized in a twelve-month. The point I wish to make is that Mr. Powell's efforts to secure the utilization of the results of his scientific investigations has been, if possible, as important to our industry as the investigations themselves, in producing these tremendous results in so brief a time.

Beyond Estimate.

It would be difficult to estimate the actual value to this State of the pathological investigations of Prof. Smith and his aids during the past few years. An approximate amount named, even well within what known facts would justify, would seem to those not conversant with his work, but gross exaggeration. But had the results, the values of which were amply demonstrated in these investigations, and reported in bulletins, been generally applied by growers, I think no one acquainted with the facts would hesitate to say that the savings to growers directly and to the State indirectly, by reason of this scientific work, would have been increased many fold.

The work with the blight, which recently threatened ruin of California's great peach industry, I think forcibly illustrates my contentions. The investigations were eminently successful in finding remedies, and the successful control of the disease was remarkably prompt and general.

The Secret of the Success.

Replying to my inquiry, Prof. Smith wrote: "I think we get about every grower in the affected regions at work, and mostly with good success. This," he adds, "was largely the result of personal effort on the part of our young men who did the work, keeping closely in touch with each individual grower and following up his work during the season. Here, without doubt, we have the secret of the scientist's success in staying this dreaded disease, wherever it has appeared, and by the ordinary orchardist as well as by the few who would have profited by the results of the investigations without any after effort by the department.

The investigations by the department into the cause and remedies of the pear scab and asparagus rust were doubtless equally successful with those of the peach disease. With practical results very meager comparatively doubtless because the work was not

E. G. Jndah, General Representative, Security Bldg, Los Angeles

View of Ranch house on the best Ranch in San Luis Obispo County, contains 425 acres, 200 of which is the finest sandy sediment soil, balance grain, and pasture land. Variety of fruit and nuts; magnificent grove of oak and eucalyptus; abundance of pure soft water; improvements cost $15,000. An ideal home, and at the same time a fine investment; present owner has made a fortune on it; Buyer can lease it for $4000, cash rent. Price $55,000, easy terms; could be cut up and sold at good profit; in fact, the 200 sediment should sell for $250 an acre quick. The same kind of soil in the Arroyo Grande Valley is valued at $500 per acre for seed ranches.

I also have a Ranch of 110 acres adjoining the town of Nipomo, all fine, rich bottom land, with $9000 worth of first class improvements, consisting of splendid home of 10 large rooms, 2 cottages rented, 2 fine barns, and water piped to all buildings; $14,500 takes the whole thing, easy terms. They are asking $150 per acre for the same kind of land in the neighborhood. This would cut up and sell in small blocks nicely; in fact, it is already plotted and maped in town lots, and there is a strong demand for small places of this kind of rich land. I also have a delightful country home one mile from the city of San Luis Obispo for $10,000.

San Luis Obispo County Farmers are making money, but prices of our lands are behind the times. Write me for what you want.

M. L. Curtis, San Luis Obispo, Cal.

California Horticultur

RAIN IS BADLY NEEDED.

THIS has been a dry season over the whole State, and especially in the northern counties are seen evidences of suffering for lack of rainfall. March, which is usually a wet month, has passed without any precipitation, except a shower on the first; grass which had barely started, is drying up, feed is scarce and both cattle and sheep are suffering. Grain is very short and unless April brings unexpected rains this crop will be a very short one. Trees are not suffering as their roots reach down to the ground water, so that, however other crops may fare, there will probably be a good fruit yield.

BIRDS EATING CRANE FLY WORMS.

The severe attack of crane fly larvae which, in many sections of the Sacramento Valley, have destroyed large extents of pasture, is reported to be practically over and the young grass is starting again. The worms which did the damage have now gone into the pupa stage or have emerged as full fledged flies and so have got beyond the injurious stage. During their worst period, very large quantities of these pests were destroyed by crows, thrushes and other birds which captured them in the shallow soil around the grass roots and devoured them in quantity. In some cases it is said that the birds had almost eradicated the pests and so saved the pastures.

AN EMBARGO ON ROOTED VINES.

A number of the counties have ordinances absolutely prohibiting the introduction of rooted grape vines and most of the other grape counties look askance at them. In view of the fact that there has been an almost phenomenal planting of grapes, especially the table varieties, in many of the northern counties in the past two seasons, the growers there are becoming uneasy about the Anaheim disease and phylloxera and every precaution is being taken to prevent these pests from gaining admittance into clean sections. Both vines and cuttings from infected sections should be barred, but cuttings from clean sections are not dangerous. It is so easy to start a vineyard from cuttings, that there is little hardship in not allowing rooted vines to be admitted and, as even a section supposed to be free from phylloxera may be infested, it is well to place an embargo on all rooted vines. There is no danger of spreading this serious vine pest in cuttings, as it is found only on the roots in our California vineyards.

GOOD FRUIT PROSPECTS.

The prospects for a heavy crop of deciduous fruit is so far very good. The season has been good so far, weather cool until the trees were ready for bloom, no frosts and no heavy rains to wash out the pollen. All trees have come out heavily in bloom, and if the unexpected does not happen, we may count on a big crop of fruit. The canneries evidently take the same view, as they are now making preparations for putting up the biggest pack for several years. Many of them are greatly enlarging their facilities, increasing their buildings and securing an unusually large stock of cans.

FRUIT MAY BE SUL

Californian fruit drier granted another year of Department of Agricultur tary Wilson has announ action will be taken a men who use sulphur fo curing of their product t matters not what decision by the commission appoi vestigate the question c sulphur, as used in the fruit is injurious or oth fruit-growers are promise for the present season's c rate. It is quite probable is not injurious this year be next, and that we shall to cure our fruit as heretc perhaps, some safeguard a inordinate use of sulphur. fruit industry of Californ great a thing, and involves to be swept out of existe out ample reason.

Ve are lessening their acreage planting with other and mor able crops.

STILL FIGHTING PEAR B

Sutter county has comme strenuous fight against the pear and the Horticultural Commi that county has issued orders inspectors to make a careful gation of every orchard and t all in which there are any evid of the blight. The owners of orchards will be notified to e the disease, and failing in county commission will do th and hold the property for th The State laws provide for the Commissioners of Sutter their determination to enfo laws.

SPRAYING.

In an interview recently Mercury reporter, Leonard C well known fruit-grower and man, spoke interestingly on ject of tree spraying. Mr. C said:

"A great many fruit grower cially those who are coming State and engaging in the bu fail yet to realize the vital imp of spraying their trees to prev check fungus and bacterial The managers of the various fr neries will tell them how mu their fruit will be worth if tr properly sprayed.

"The time is coming on wh trees should be sprayed with Bord mixture to prevent curl leaf. In vember all peach, apricot and trees should have been treated sim larly to prevent shot-sole or pe blight.

"It is a very simple and inexpensiv operation, but it must be done righ or time and money are wasted."—Sa Jose Mercury.

es and Their Care

ALUE OF HONEY.

g to Dr. Paul Denade, uld occupy an honorable therapeutics says Coleman's e relates that a lady asked about a tiny, emaciated e child, which lay in its arms, was nine months old, one the feeling that it had ose its little eyes for death itself. The infant was suf- m diarrhea, which had re- yield to all remedies tried; the e creature was emaciated to ne degree, with black rings eyes, and the lower stom- ully large. The poor suffer appetite whatever, but was ce plagued with almost in- omiting and diarrhea. He er to feed the infant on d water, nothing else abso- eight days, and if the child living at the end of that give goat's milk and water oportion of one to two parts ly. "I dismissed the case mind, since I did not hope ing better than death as a says the doctor. "What astonishment when, at the hree months, I was shown a ooking, well nourished baby, excellent appetite and regu- s. and its stomach reduced Here was my wretched nothing less than metha- d by means of honey. l proportions, may be easily

CISM OF THE USE OF THE WORD "QUEEN."

ame "queen" as applied to ler bee in bee culture, is a r. The word carries with ea of royalty, empire and , and signifies, when applied ndividual, that she rules or the colony in which she has n. Nothing can be further th. The colony is not an and she exercises no do- ver it or its inmates. She is he mother bee, and nothing colony of bees is a commu- nsects, in which each mem- so-called queen included, its respective duties for the the whole, and in which each in its sphere, has equal nd privileges. The name, as to this insect, had its origin ark ages, when the people in royalty, and the doctrine gs and queens ruled by divine ut in this enlightened age, ll people know better, is it to drop this misapplied nd call this insect the " which fully describes her? Coleman in Southern Agri-

CARE OF BEES.

n hives with good brood s equal to the laying capac- e queen are considered best ering; the stores are usually . When all breeding is over season the central combs are eficient in stores. Here a ractical feeder comes into on, one that can be used the cold nights of October t will work successfully with rup. Nothing is gained by ng bees to evaporate a large of water so late in the sea- r late feeding use about one f water to every fourteen of the best granulated sugar. When early feeding is practiced thin syrup may be used, but for late feeding we need the syrup very thick, just thin enough so the bees can work it nicely.—American Agriculturist.

THE HONEY BEE.

If you "keep a bee" you should also have some strawberry plants. It is said that a swarm of bees will visit 10,000 strawberry plants in one day.

Honey should be stored in a cool, dry place.

Bees should be kept dry and warm and have plenty of food during the winter.

Actual experience is the only way in which success can be attained in bee-keeping.

BEES ON THE FARM.

Every farmer should have a hive of bees on the farm, even if he attaches but little value to the honey. The bees are excellent foragers and carry pollen from one plant to another.

In communities where no bees are kept there will be found orchards that do not bear, the cause being unknown, while a hive or two of bees in the neighborhood would change the conditions.

For those who have weakened digestive powers honey is said to be a very desirable food. If a person is very tired—too exhausted to eat—a few tastes of honey will act like magic.

All the hives in an apiary should be made of one design out of well seasoned white pine or other white wood; they should be planed inside and painted blue outside.

It is said that Germany produces more honey than any other European country; she furnishes 20,000 tons annually.

GETTING EVEN.

"No, I don't believe in expensive practical jokes," said a San Francisco business man, "except by way of retaliation,"

"Now last year I received a telegram from a friend who was traveling in Italy. It came collect and cost me seven dollars; and when I opened it all I read was, 'Thank you, I am well.'

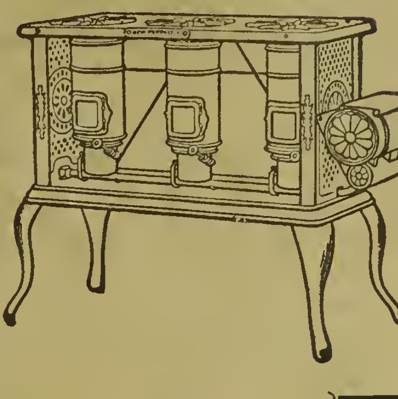
"Then I sallied forth and sought me out a cobblestone—a nice, large, cobblestone weighing about eleven pounds. And I wrapped it in excelsior, pink cotton and white paper, and I boxed it up in a handsome box; and I sent it by express, collect, to my facetious friend far across the bounding billows.

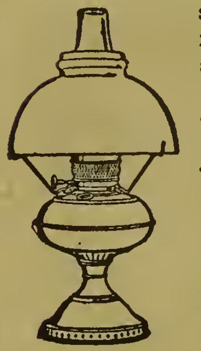
"And when he had paid his litle fifteen dollars, and had opened the box in St. Petersburg, if I remember rightly, he found in addition to the precious contents a note from me that explained, 'This is the load that rolled off my heart on receipt of the news of your good health.'"—Woman's Home Companion for April.

The date fixed for the beginning of mohair sales at Dallas, Oregon, is April 17th.

The immense pre-cooling plant at San Bernardino is ready for the present shipping campaign.

The Riverside Development Company is pumping 70 inches of water from a recently completed well.





Put This Stove in Your Kitchen

It is wonderfully convenient to do kitchen work on a stove that's ready at the instant wanted, and out of the way the moment you're done. Such a stove is the New Perfection Wick Blue Flame Oil Cook-Stove. By using it you avoid the continuous overpowering heat of a coal fire and cook with comfort, even in dog-days. The

NEW PERFECTION
Wick Blue Flame Oil Cook-Stove

is so constructed that it cannot add perceptibly to the heat of a room; the flame being directed up a retaining chimney to the stove top where it is needed for cooking. You can see that a stove sending out heat in but *one* direction would be preferable on a hot day to a stove radiating heat in *all* directions. The "New Perfection" keeps a kitchen uniformly comfortable. Three sizes, fully warranted. If not with your dealer, write our nearest agency.

The Rayo Lamp is the ideal lamp for family use—safe, convenient, economical and a great light giver. If not with your dealer, write our nearest agency.

Calendula is first cousin to the marigold; calliopsis is a more graceful grower than either of them, and deserves a place in every garden.

No truck gardener or farmer should contract to sell his products at stipulated prices the entire season.

The Vegetable Gard

SPRAYING THE GARDEN.

How can I handle the pests of the garden, is a perplexing question with many gardeners. Here are a few suggestions:

Asparagus.

Beetles—Keep beds closely cut in spring and protect later with poison, preferably arsenate of lead.

Rust—Spray thoroughly a few times in July and August with diluted Bordeaux. Set plants on good land, and keep them in vigorous condition.

Bean.

Anthracnose—Spray with Bordeaux mixture when the first true leaf appears, making a second and third application when it is necessary to keep the foliage covered.

Bean Beetle—Kill grubs on under side of leaves with kerosene emulsion (one to eight) or spray with arsenate of lead.

Bean Weevil—Fumigate beans for 24 hours in a tight vessel, using one tablespoonful of carbon bisulphide to the bushel.

Flea Beetles—Spray with poisoned Bardeaux mixture.

Beet.

Leaf Spot—Spray with Bordeaux mixture when four or five leaves have expanded and repeat two or three times at intervals of 10 to 14 days.

Cutworms—Use poisoned baits and prevent attack by early fall plowing, harrowing or disking.

Cabbage and Cauliflower.

Aphids—Spray with kerosene emulsion or a whaleoil soap solution, when numerous, and repeat if necessary.

Cabbage Worm—Spray with a poisoned rosin-lime mixture, if plants have not headed; otherwise use hellebore or kerosene emulsion.

Cutworm—Protect stems with bands of paper or use poisoned bait.

Harlequin Cabbage Bug—Sow mustard early and destroy bugs thereon with kerosene or resort to hand-picking.

Root Maggot—Protect plants with paper collars or wet the surrounding soil with emulsion composed of one pound of soap, one gallon of boiling water and one pint of crude carbolic acid diluted with 30 parts of water.

Celery.

Blight—Make fortnightly applications of Bordeaux mixture until plants are one-half or two-thirds grown, then use ammoniacal copper carbonate every 10 to 15 days, if the weather is rainy.

Onion.

Celery Worm—Hand picking.

Blight—Spray with two-thirds strength Bordeaux mixture at ten-day intervals.

Maggot—Wet the surrounding soil with carbolic soap wash, or remove the soil about the plants in the morning, replacing at night, so as to allow some drying of soil about the maggots.

Pea.

Aphids—Plant early varieties or spray with kerosene emulsion or a whaleoil soap solution, when it is necessary.

Pea Weevil—Same as for bean weevil.

Potato.

Spray with poisoned mixture at two to three-we vals for blight, potato bee flea beetles.

Scab—Soak uncut tubers one-half hours in a solution half ounce of corrosive sub eight gallons of water, or hours in a solution of one formalin to 15 gallons of wa

Squash.

Squash Borer—Slit infeste and destroy the borer, cover injured part with earth early trap vines.

Squash Bug—Trap bugs shingles laid about vines, d them every morning, and cr clusters. See, also, cucumbe

Tomato.

Leaf Blight—Spray with B mixture at seven-to-ten-day vals.

Flea Beetle—Spray with Bordeaux mixture as needed

Rot—Treatment same as blight, though usually u tory.

Tomato Worm—Hand spray with poison.

Sweet Potato.

Black Rot—Select clean roll in sulphur, and, if possib in soil free from infection.

THE EARTHWORM.

Little and unpleasant as an worm is, Mr. Darwin thought portant enough to spend thirt of his life in experimenting up It is blind, it is deaf, it is lives in the cold, dark earth, knows how, better than any the world, to plow the ground all the green things can gro

Would you believe it that chesnut tree from which yo fond of gathering nuts needs of the earthworm? It plow ground by turning it over and ing it up so that light and sunshine and rain can get To be sure, it needs mill worms to effect much goo worms cast up piles of ear the longer they work the thi layers grow until they form table mold. Nearly every this vegetable mold has been the bodies of these worms, soil where this mold is f finer, darker and richer. It because it has been ground up little stones in the worm's giz is darker and richer because been mixed with juices a leaves in the worm's body.

The worm has been cal most wonderful plow in the Remember all the good th worm does, and the next t see one don't crush it u foot, but give it a chance t wonderful work, for without grass, flowers and trees woul destruction.

Holes should be dug large eno to take in all the roots spread out their natural position. The surfa soil should be worked in among t roots and pressed very firmly abo them, except an inch or two of t surface to act as a mulch.

Potatoes require an abundance available plant food to have lar yields.

THE "BOSS"

ld-fashioned flowers are as good the best and will flourish where "improved" would die.

The Ornamental Garden

PERENNIALS.

FOR general home flower gardening there is no class of plants more satisfactory than the hardy herbaceous perennials.

This is due to the fact that when once established they do not require as much or as particular attention as the annuals. And, then, they afford such a wealth of blossom and foliage that their proper use adds greatly to the attractiveness of any home. Besides these very desirable qualities they afford an opportunity for the studiously inclined to develop a most legitimate, artistic taste, through a study in harmonious arrangement.

We might say that they differ from hardy shrubs in that their tops die back each winter, and from the annuals in that their roots survive from year to year, increasing in size and vigor each season. From these clumps of roots, in early spring, there arises a strong, vigorous plant, which in its season affords a glorious array of blossom.

As a general consideration the perennials are best adapted to a position in front of the shrubbery section, with a southern aspect, which gives a proper background for the display of their floral garb. A few are suitable for individual specimens, but the best results will be obtained from mass planting, and that rather thickly.

The most satisfactory scheme of planting is one in which the several kinds of plants are grouped in more or less distinct sections, according to their floral colors and general height. These sections should rather indiscriminately merge by judicious mixing from one to another and should further be arranged so as to supply succeeding crops of blossom well distributed over the entire bed or border. The object being not to pass abruptly from one class of flower or blossom to another and thus give a stiff, formal effect, but to merge the various colors into a happy informal group.

Individual taste and experience must necessarily enter prominently into any scheme that may be decided upon. One advantage of this section of plants lies in the fact that they may be changed about, almost at will, so as to bring out the desired effects. In fact, constant minor, yearly changes should be made in order to bring out new features and floral pictures. Besides, all the roots will need dividing every two, three or four years in order to promote health and vigor and to preserve the general plan.

Now, in reference to the preparation required previous to planting, we would say that too much attention cannot be given to this feature. The soil should be rich, porous and well drained, and at the same time retentive of moisture. The bed should be stirred deeply and well pulverized. This will give a very congenial environment in which the roots may attain to their largest proportions, thus providing the nourishment for the strong, healthy plant supporting a massive array of blossom.

Gross neglect along these lines will invite failure of similar proportions. The fertility of the soil should be constantly maintained by the addition of barnyard manure applied in winter after the ground has been frozen. This will form a mulch for winter protection which is usually quite desirable, and when spaded under in the spring, will add the necessary elements to the soil to maintain its fertility.

Returning to the plants themselves, we will suggest a few of the best and most commonly accepted individuals, giving their habit of growth, color of blossom, period of blossom and any other information within the limited scope of this article.

Aquilegia coerulea (Rocky Mountain Columbine): One foot. White and blue. June. A most popular plant for mass effects. Aquilegia chrysantha (Golden spurred columbine): Two to three feet. Yellow. June. Very hardy and desirable. Coreopsis: Two feet. Yellow and red or brown. July to September. A very handsome flower. Shasta daisy (a hybrid): Eighteen inches to two feet. White. July to August. Especiallly desirable for border planting. Nice for cut flowers. Dianthus harbatus (Sweet Williams): Twelve to eighteen inches. Variety of color in whites and pinks. July to September. A good hedder. Dicentra spectabilis (bleeding heart): Two to three feet. Pink and white. May to June. A very pretty flower suited to shady places. Delphinum (Larkspur): Three to four feet, White or blue. June to July. A very handsome flower. Suitable for specimen planting or in the back ground. Often needs support. Gaillardia: Two feet. Orange. June to October. A very nice flower for cutting. Good clumps are very showy. Althea rosea (Hollyhock): Five to eight feet. All colors. August to late fall. Place in back ground. Iris kaempferi or germanica (Japanese or German Irises): Two to three feet. White to blue or purple. May to July. Similar but superior to common flag. Increasingly popular. Best grown in masses. Lathyrus latefolius (Perennial sweet pea): Four to eight feet. White and red. August. Not suited for border. Efficient for covering trellises, rocks or similar rough places. Does well in shade. Monarda Didyma (Oswego tea, Bee Balm): Two feet. Scarlet. July to October. A very showy flower for mixing in border. Paeonia officinalis (Paeonia): Two feet. Variety of colors. May to June. Good specimen plants. Also adapted for massing. Need deep, rich soil. A most pleasing roselike blossom. Superb. Phlox paniculata (perennial phlox): Two to three feet. Variety of colors. June. Very showy bedders. Papover orientale (Oriental poppy): Two to four feet. Scarlet. June or July. Produces a very large, showy blossom. Papover nudicavle (Iceland poppy): One foot. Yellow; also white and orange. Mixed border. Penstemon barbatus (heard tongue): Three to four feet. Crimson. June to September. Bears long spikes of flowers. Rudbechia (Golden glow): Five to six feet. Yellow. August to September. Splendid specimen plants, making a showy display. Tritoma pfitzerii (Red hot poker): Two to three feet. Orange red. August to September. A very desirable bedding plant with a showy effect.—L. M. Montgomery, Gardener, Colorado Agricultural College.

Bulbs should not be left lying about exposed to the air. Plant as soon as received.

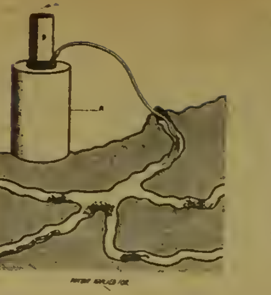
There are both annuals and biennials in the Pink family; the carnation proper is a perennial.



Kill the Pocket Gopher, Moles and Squirrels

The Peerless Destroyer generates gas from carbide (a cheap substance, which can be bought anywhere,) instantly forces the gas into their holes at the rate of five feet per second, for hundreds of feet, making a wholesale killing of every live thing therein. They stop breathing when the gas overtakes them. No pumping, no trouble. The gas is harmless in the open air, but confined in their holes kills them by the dozen in a single operation. Not an experiment, but a sure thing. FULLY GUARANTEED. Perfectly safe, easy to operate, fully meets the demand for a wholesale destroyer of the pests. Will last for years. The cost is nothing for the work it will do. Full equipment, including sufficient carbide to clear any ordinary ten acres, ready for instant use, sent express prepaid on receipt of price, $3.00, without carbide $3.50. Your money back if it fails to do the work. Write today.

Irrigation and Foresti

IRRIGATION IN ITALY.

IN a bulletin issued by the department by Dr. Elwood Mead, is the report of the observations on irrigation in Italy made by Dr. Mead in the summer of 1903, and it deals with the section watered by the Adda and Adige rivers, taking up especially the legal and institutional phases of irrigation and describing the operation of canals controlled by the government and those controlled by co-operative associations of water users.

The history and present status of the irrigation laws of Italy are given, with some comparisons with American conditions. The development of irrigation laws from the early Roman law to the present time is sketched and a statement of the present law, enacted in 1884, is given. The unification of Italy as a kingdom made the national government the successor to all the water rights which had hitherto belonged to the separate provinces, and one of its first acts was the declaration of the public ownership of all unappropriated public waters. This was followed by the enactment of a law providing for the determination of what are public waters and the compiling of a list of all rights to these waters, and making provision for the acquiring of rights in the future by grant only.

Concessions are now granted either by a law of the kingdom or by an administrative decree, and are always made subject to existing rights. As a rule they are limited to thirty years, but perpetual rights may be granted by a law of the kingdom. While the law makes the nation supreme in matters relating to the granting of rights for irrigation, it entrusts the exercise of this authority to local officials in the granting of rights of only local interest. This division of power has not, however, been satisfactory, at least to the officials of the general government, and a commission was appointed in 1898 to recommend changes in the existing law. This report shows that the reason assigned for the appointment of the commission was the claim that the provincial officials were not exercising the proper care in the granting of rights, especially for the development of power, but were allowing power rights to get into the hands of foreign capitalists, who were establishing a monopoly for the exploitation of the real users of water. The proposed cure for this threatened monopoly of natural resources was to give exclusive authority to grant such rights to the general government. This commission recommended tho creation by law of a permanent board to which all such applications should be referred. No such law has been enacted, but a commission formed on the lines recommended has been created by royal decree, which, however, acts in an advisory capacity only.

The kingdom of Italy charges for water diverted from public streams, tho amount of the chargo being fixed by law. The charges for water for drinking and for irrigation without the obligation to return tho waste water is but one-half as great. Whero it is impracticable to measure tho water diverted the charge is 40 per acre irrigated. The place of the water is not limited, the having the right to use the wa to sublet without limit on the

In addition to controlling streams the government owns c canals which are leased as a v and other canals which are ope by the government with lease sociations of water users or viduals.

Further aid to irrigation is the government contributing cost of construction of works b associations or individuals. T is conditioned upon contributi the provinces and communes the works are situated, the contributions being not less th tenth of the sum granted by ernment. The aid given by th dom is a part payment of the on money borrowed to carry work. The total contribution ally 3 per cent of the estimate of the work annually for the years, 2 per cent per year for a period of ten years, and 1 p per year for a third period years. This aid may be give large or complete works as we new works.

The government further ai tion by granting loans from banks. The procedure for these loans, the amount of int be charged, and the security to manded are all fixed by the M of Finance. The maximum per loans is ten years, except wh sinking fund is provided, whe maximum period is 25 years.

Associations for the constructi irrigation works through govern aid are provided for by law. Th sociations may be either volunta obligatory. Obligatory assoc are organized by the courts on t e plication of a majority of th ested and are in fact similar to gation districts or drainage in this country.

The report describes the op of a typical government canal a two association canals, illustratin operation of these laws.

ARABIAN ALFALFA.

Because of the numerous in for the Arabian alfalfa and Egy cotton, we inquired of the A tural Department where a q could be obtained. We are i by the authorities that there ly sufficient seed in the count experimental purposes and n be had from abroad, but that t partment hoped to have sufficie general distribution next year.

BRESS DE GOOD LAWD

The "professor" (no, it w Patty) had just finished his show in a Southern town. T darky janitor sidled up and "Excuse me, boss, but kin I ax question?"

"Certainly, uncle."

"Dis yere contraption of you can see clean thro' a man?"

"O, yes."

"Kin you see what he has b eatin' of?"

"O, yes."

"Well, boss, if a man has been e in' chicken, can you see dat chik en?"

"Yes, indeed."

"Dat suttenly am curious; bu say, boss, can you tell whar d chicken come from?"

"O, no."

"Bress de Lawd! He sure do loo out for the nigger."—Sel.

varying with the temperature, set the barrel in a cool cellar. Keep it closely tied and covered.

Another way is to put the sliced cabbage in inch-thick layers, salting lightly and pounding down each layer. Cover with board and weight, and pour over cold water until the cabbage is covered. Set in a moderately warm place until fermentation ceases. This will be shown by the disappearance of the bubbles at the top. The liquor must at all times cover the cabbage, or it will turn black and spoil.

Polishing Pecans.

Sometime since the Cultivator had a query as to polishing pecans. A limited answer was given then and a letter sent to the department at Washington for information, as no information seemed to be in hand here. To this query are received the following from Wm. A. Talyor, pomologist in charge of field investigations:

Replying to yours, addressed to Dr. Galloway and by him referred to me, I would state that the polishing of pecans as done in the commercial establishments, is usually accomplished by placing them in a revolving cylinder made of wood or woven wire which is so arranged that it can be whirled rapidly, the polishing being thus accomplished by the friction or rubbing of the nuts against each other and against the sides of the cylinder.

"Tinting" is accomplished by using the desired color in the form of dry powder or liquid added to the nuts in the polishing cylinder. Where tinting is to be done, the cylinder must be practically water-tight.

Neither of these processes adds anything to the quality of the nuts. In fact, in some markets, with the better grades of nuts, polishing depreciates the selling price. For low-grade nuts it possibly results in higher prices as the nuts can be made more uniform in appearance in this way. But in view of the fact that the practice is sometimes resorted to in a way to disguise stale or other inferior pecans, it is very doubtful whether the practice results in any benefit whatever to the producer in the long run. A simple washing and rubbing of the nuts to remove adhering particles of hull is really all that is needed to put them into good marketable condition and is all that we would advise.

Blue Stone for Watermelon Seed.

In the Cultivator for March 12 there was an article on watermelons for profit. Among the many suggestions given, Mr. Ostergard says: "Do not forget to bluestone your seed." This would be very valuable to me if he had explained how to do it. We have never heard of the use of bluestone on watermelon seeds, I presume it prevents wood-rats from digging up the seed, and that is what troubles us very much.—L.

The only advantage of the bluestone, is that it may prevent blight. We say "may prevent," for many best growers believe it of no value. However, the treatment is to immerse the seed in common Bordeaux mixture. The formula for this was in the spraying page of the issue of March 12.

Also a query from Dinuba asking same question. Says that no growers there know of use of bluestone.

MORSE SEEDS SPROUT—YOU AND NATURE DO THE REST
PACIFIC COAST HEADQUARTERS for BEST SEEDS

SEEDS We Grow Them—YOU SOW THEM

If interested in a quick growing valuable tree you can plant on unused ground read the following about

ACACIA MELANOXYLON

Baron Von Mueller, in his "Select Extra-Tropical Plants," writes of this tree:

"This well-known Blackwood of our river flats and moist forest valleys. In irrigated glens of deep soil, the tree will attain a height of 80 feet, with a stem several feet in diameter. The wood is most valuable for furniture, railway and other carriages, boat-building (stem and stern posts, ribs, rudder), for tool handles, crutches, some portions of the work of organ builders, casks, billiard-tables, pianofortes (for sound boards and actions), and numerous other purposes. The fine grained wood is cut into veneers. It takes a polish, and is almost equal to walnut. Our best wood for bending under steam; it does not warp or twist."

The great billiard-table firm of Alcock & Co., in Sidney and Melbourne, have been making tables from it for the last eight years, and at the exhibition of 1888, there was a piano cased with it which was as handsome a piece of parlor furniture as one could wish to own. The Martini-Henry Rifle Co. have been using it for gun stocks for the last fifteen years, because they could get it much cheaper than the French walnut hitherto used by them.

We have a fine lot of these trees, which you will find priced on page 73 of our 1908 catalogue, mailed free, on request.

Not Connected With Other Stores

Intelligent Buyers
Appreciate Our Methods

Stores using the sensational special reduction and great discount methods are often considered low priced, while stores transacting business on a straight price system are assumed by many to be high priced. A little careful consideration will show you the error of this assumption and convince you of the advisability of buying under our system of pricing and selling, furniture, carpets and draperies.

Our Store Is the Low Priced Store

We have but the one price for all and that price is as low as it is possible to sell good qualities. If furniture is originally priced right there can be no special reductions or discounts. Stores employing such methods must price their goods high to provide for the great reductions. Such stores must then be high priced and you are paying much more than the goods are really worth. Our every day, plain figure prices are the right prices and are lower than you will find such goods priced elsewhere. We have the largest and finest stock on the Coast.

Water Stock...

I noticed sometime ago a reply in your paper to some one's query in regard to ditches. I have a question I would like you to answer. If a man owns stock in one of the Imperial water companies and they allow him to place this stock on a certain piece of land, are they compelled to furnish him water at sufficient height to irrigate it even, if it should necessitate raising the banks of their ditches in order to furnish the water? After they have allowed the water to be checked up high enough to water the land after seeding, can they refuse to check to this height again and cause him to lose the crop? —B.

Generally such a query would be answered by the by-laws and rules of the company. However, as the crop was put in and water supplied for one irrigation, the implication is that that crop should be carried to maturity or the company make good the loss. Besides, if the water stock was placed upon this particular land with consent of the company, the assumption is that the "water should follow the stock."

Apiary Men.

Will you please favor me with the address of some of the chief apiary men of California and also tell me of whom I can get stock for the business such as hives and fixtures.—J. C.

The officers of the State association recently elected are:

J. M. Williams, Pasadena, president; E. A. Holmes, Orange, secretary and treasurer; the vice-presidents to represent counties as follows: L. E. Mereer, Ventura; B. C. Sehrock, Riverside; G. F. Merian, San Diego; B. G. Burdiek, San Bernardino; G. Lynn, Los Angeles; F. Hart, Kings; J. E. Pleasants, Orange; A. J. Bauer, Kerns; W. A. Pryal, Alameda; J. W. Gwin, Imperial; J. MeCubbins, Fresno and Muth Rasmussen, Inyo county.

Pear Blight.

I have some pear trees in my orchard, and one of them from which I send you the enclosed piece is affected, as you see, with some kind of disease. Will you kindly advise me how to treat it? I will be very thankful. I am one of your new subscribers, and I am well pleased with the paper. S. G. S., Stevenson.

CULTIVATING LILIES IN NEW JERSEY.

The twig was submitted to Prof. Smith at the Pathological Laboratory, and we have the following:

Your forwarded letter from S. E. Sorensen to the Cultivator Publishing Company is at hand. As Professor Smith is away at present, I am answering this letter.

The specimen enclosed is too small to tell anything about it at all as regards whether it is pear blight or not. However, it does not seem to be anything but a drying out of the end of the shoot for some reason or other. If the enquirer is very anxious to find out the real cause of the trouble we will be glad to help him, providing he will send a larger and better specimen than the one already sent. H. J. Ramsey.

Blackberry Rust.

Enclosed please find samples of Loganberry leaf which seem to be diseased. I have two vines which seem to be affected in this way. Can you tell me, through the columns of the Cultivator, what is the troublo and what is the remedy? E. R. H., Woodland.

The above, with another from Corning, were submitted to Prof. Ramsey at the Pathological Laboratory, and he writes:

The samples of loganberry leaves which I find enclosed coming from Corning and Woodland, are both affected with the same disease. The leaves are affected with rust which is quite ge

HOW MAY THE RESULTS OF SCIENTIFC INVESTIGATIONS BE BEST APPLIED?

Continued from Page 383.

followed up with growers as it was with the peach growers.

Can't Afford Not to.

It may be urged that the State can not afford the expense of this supplementary work. It seems to me it cannot afford not to if it be true that the real object of the investigations largely fail to be secured without it. If without it, the benefit from the large public expense accrues largely but to the few, while the many who need the help most, do not avail themselves of it. It is because this supplementary effort in behalf of the masses is recognized that we find small demonstrative government farms scattered through the more prosperous agricultural districts of Europe, and even in Japan and China.

Co-operative Associations.

Next in efficiency to this government supplementary aid in having results of valuable investigations more generally utilized, I think may come the efforts of co-operative organizations of growers. The possible weight of such organized influence is forcibly indicated in the experience of the Southern California Fruit Exchange in connection with Mr. Powell's work. Its valuable support of the investigations from the first, and its efforts through its auxiliary associations to have the results at once utilized, have been among the most important factors in securing its phenomenal success in many sections, and through these efforts the industry generally may be led to utilize its important benefits more rapidly, perhaps, than any other.

Farmers' Club.

The lapse of Farmers' Clubs, so popular a few years ago, for various reasons, I think a matter of sincere regret. The most rapid progress made in the general adaptation of improved methods in the history of the citrus industry was made during the few years immediately preceding and following the commencement of the new century. During that time there was a live horticultural club in nearly every orange-growing center in Southern California. We need these means today to help secure the more general use of valuable scientific discoveries pertaining to our industry.

Bulletins.

I think we all recognize how far short of reaching and influencing the average farmer the voluminous bulletins sent out by both State and national experiment stations come. To make these valuable documents serve their purpose more fully, is needed some sort of organized effort to call more general attention to their practical value.

A Serious Consideration.

I will detain you with but a single other thought, one which, it seems to me, portends ominously for the near future of our industry, unless special attention is given it. If I am right, it is a matter that should constitute one of the strongest inducements for securing more general application of results from scientific investigations. There are things of more worth than accumulated money, after one's real needs are supplied. Fixed conditions being equal, that the large citrus fruit grower with ample means has important advantages over the small grower, cannot be questioned. If to these natural advantages of large growers be added the important acquired benefits of promptly utilizing results of scientific work, and if small growers are allowed to ignore these advantages, the result, it seems to me, is inevitable. For instance, if the men who, by availing themselves of the improved methods indicated by Mr. Powell's researches, are receiving a large margin of profit because of this alone when the time comes, as it surely will come, when this margin from careful handling will measure the entire profit to growers, those persisting in old methods must abandon the industry, and the small holding will gradually drift into the hands of those with enterprise enough to apply improved methods when discovered.

The Small Grower Must Wake Up.

None of you appreciate more than I the value to our industry of such men as the Chases, Rumsey, Teague, Mills and other broad-minded, public-spirited, unselfish men of their type, who are doing things on a large scale. We need the object-lessons they are giving us. But you know as well as I that for the most part it is a different class of men who will gather in the small holdings, when no longer profitable to their owners, because of their neglect to utilize the improved methods that have been demonstrated. I remember when the village blacksmith made my father's plows—when my mother wove the cloth for my clothes. It is true that all this sort of thing had to pass through the various stages to the big factories. But this need not apply to our agricultural industries. The small fruit grower may stay.

Scientific research has made it possible for the small holder to successfully compete with the large landlord, but to do so he must be induced to apply the better methods when demonstrated—and it is to the interest of all that he should be.

Better for All.

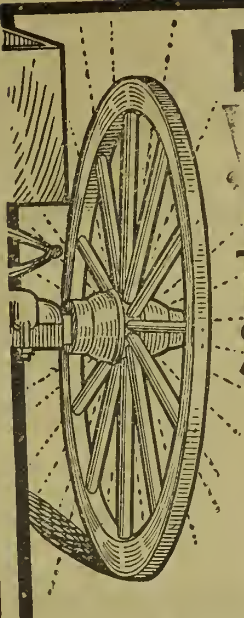
I am sure you will agree with me that it is far better for the community, for the State, for business generally, for one hundred intelligent families to own and successfully manage five or ten acres of orange orchard each than it would be for one man or one firm, with a few expert foremen, and a large force of wage-earning laborers, to manage these 500 or 1000 acres.

A Hundred Homes.

That it is far better, in the interests of best citizenship, to have a hundred homes of freeholders scattered over these 1000 acres of orchards, the occupants largely doing their own work, even with a small annual income to each, than to have this area owned by one man, with the work done by temporary employes, massed in quarters, without home influences, however comfortable they may in themselves, and the aggregate annual profit going into one pocket.

The Fault of the Small Grower.

While it is true that, if this tendency towards small holdings being converted into large, under single management, it will be the fault of the small growers. Nevertheless, it would prove a misfortune to our State; and for this reason, as well as for the individual benefit of the average farmer, I believe special effort should be made to secure more general results of scientific investigations.



Don't Wait 'till They Sing

You make yourself unneccessary expense for repairs every time you use a poor wagon grease or allow an axle to go dry.

An occasional application of

MICA
Axle Grease

removes two thirds of the trouble and cost of keeping a wagon. Try "Mica" next time you go for a load—you'll *see* the difference and the horse will *feel* it.

Mica Axle Grease is almost as good as roller bearings. Ask the dealer for it.

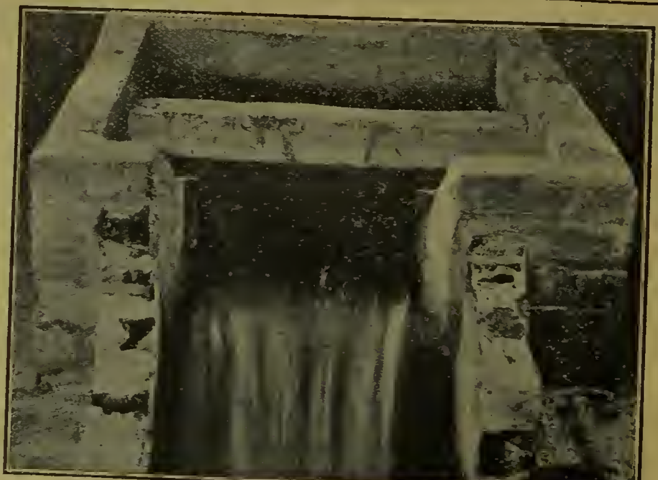
Pumped by The New Pomona Deep Well Pump Head



Pomona Mfg. Co., Pomona

POMONA MANUFACTURING CO., Pomona, Cal. Riverside, Cal., October 8, 1907.

Gentlemen:—In reply to yours requesting privilege of photographing our pumping plant which you installed for us last spring will say: You are perfectly welcome to take as many photos as you wish, and as our season for pumping is practically over, it may be of interest to you to know something of what we have been doing with it. We have raised forty inches of water about two hundred and fifty feet, delivering it through a six-inch pipe line to our reservoir about one and one-half miles distant from the well. The pump is driven by a forty-horse power electric motor, and our tests have shown the actual horse power used to be twenty-seven horse power. The pump has worked perfectly all through the season and is in perfect condition today. It has come up to all that you represented it and met our every expectation. Should you wish to refer to our plant at any time, you will always find it open for your inspection. Yours truly,

California Trees and Flow

Written especially for the California Cultivator

BY O. M. MORRIS OF MORRIS & SNOW SEED CO., LOS ANGELES, C

"IN all parts of the civilized world, the refinement and happiness of all the people may be measured by the flowers they cultivate," says an eloquent author. I might add that the wild flora of a country must furnish a truthful index to the adaptibility of that land as a home for the human race, for, where they abound, there, too, man may seek for fruitful toil, pleasure and rest. And, where more lovely flowers, more brilliant tints, or more delicate colorings, or more wonderful trees than in the mountains, canyons and mesas of California. And where may a more perfect abiding place be found for man.

It has been stated that California has furnished to the horticulturist a greater variety of beautiful flowers and stately trees than any other State in the Union, including over 50 varieties of Conifers alone. A list of the more worthy subjects will be attached with the desire that all may become better acquainted with them and use them more in the ornamentation of their homes and parks.

There is a striking peculiarity with most of our native trees in that they are not easy to transplant. This is owing to the peculiar system that these plants have developed—from necessity in sustaining them from the drought. A very coarse, heavy tap root or deep growing root with so little fiberous rootlets, and when these large roots are disturbed or too severly cut the plant or tree perishes—and this is the principal reason for lack of our native trees having such little space in our cultivated garden. The nurserymen have seemed indifferent to their growth, and have looked to India, Australia and South America for plants and trees not a bit more ornamental or more beautiful in flower than are our native shrubs and plants. For what State or country can furnish us with a more wonderful flower than the Matitija poppy (Romneya Coulteri) or the California poppy (Eschscholtzia) or the Mexican poppy (Hunnemania), or a more perfect tree or foliage than the Catalina cherry (Prunus Integrifolia) or our wild plum (P. Illicifolia) of the mesas which are practically the same, the live oak or the more showy shrub, the California Holly (Photinia Arbutifolia) or more striking and drouth resisting plants than the "Palo Verde" (Parkinsonia) or Mesquite (Algeraba.)

Well does the writer remember the great effort with which the late Mr. Smiley labored in collecting and planting our native plants at Redlands and with what little success. But he has given us some valuable lessons in this as with many other wonderful demonstrations, and may the monument he built in Redlands (the Smiley Heights and Park) never fade and the work that he commenced never lack for proper support.

The following list of native plants is greatly abbreviated, but are mentioning the most prominent of our native flora:

Abronia (wild Verbena) is a trailing plant of the verbena family growing but a few inches high, but is hardy in the most sandy locations, either interior or on the sea coast sand dunes.

Abutilon (Aurantiacum) said to be one of the finest of this species. Found quite common in low Diego county growing from e 12 feet high and blooms in sion.

Aquilegia (Columbine) fou our mountain canyons more o distributed throughout the Sta very fine little plant for shrub location, blooming durin summer months.

Arbutus Menziesii (Madrone handsome tree often of large p tions, sometimes growing 100 high. This has a peculiar re brown bark and large waxy flowers, and in the late fall in great masses of orange re ries about the size of the holl ries. These are largely used florists about San Francisco f holiday trade. They are not common in the southern part State, but grow very luxur throughout the northern par consider this one of the most ing and handsome trees gro the Coast.

Ceanothus (the wild lilac Pacific Coast.) These are a green shrubs or small trees dense, showy masses of bl white flowers during the win early spring, followed by during the latter part of the s

Cascaria Sagrada (mountain tree) growing in all our canyo profusion through the State. quently on very gravelly, ab rocky places. Very hardy and a ty evergreen small tree.

Conifers, including cypress pines. It would be impossible i article of this kind to descri these many varieties, but they well adapted to most of the l in the State, and though s largely used, but few varie common.

Fraxinus Dipentata (floweri This variety is found in San county and through lower nia and is a very handsome tr ducing in springtime a profusi white flowers, and said by so surpass most any of the ash.

Heteromeles, Arbuti folia (C nia holly), sometimes class Photinia. This is our most co shrub found everywhere in the throughout the mountains, a known to every school child a fornia holly used at Christmas So far in the southern part of State this has been given very space in our gardens, wholly on count of its being a little difficul transplant, but the seeds grow r ily if planted and cared for other seeds.

Rhus Ovata and R. Integri are common evergreen shrubs w dark red berries. These are useful on hillsides and should grown naturally without trim making a beautiful, green growing close to the ground a eight or 12 feet in height.

Simmondsia Californica, a low dense branching shrub forming ov bushes five to 15 feet high. A fine evergreen with edible nuts.

Torreya Californica (California nutmeg. An evergreen tree growing 60 to 70 feet with slender, drooping branches. Very common in the central and northern part of the State.

Prosopis Dulcis and P. Horrida (Mesquite bean) also known as Algarobia Glandulosa, found in the des-

have heard of the elms of New
or of the lindens of Berlin.
ow know that there are many
of substantial and beautiful
not native to the State, which
e grown to a fair degree of
ion. This knowledge has been
at the expense of much time
and money on the part of numerous citizens who have had faith in the country.

Give the youngsters some property interests and some definite work that they may enjoy and the problem of keeping them off the streets will soon be solved.

Buy trees from reliable sources and be content with those of medium size. A tree from five to ten feet in height, if well grown and vigorous, will usually outstrip larger ones in a short time in this climate. Remove a portion of the top, cut off all bruised roots, and shorten the very long ones, and above all do not expose the roots to the drying action of sun and air; keep them moist and well protected at all times.

Plant in good soil and make the hole for the tree deeper and wider than is necessary to accomodate the roots. Fill in the bottom of the hole with loose top soil and plant the tree only a little deeper than it stood in the nursery row. Do not pack the soil too firmly about the roots, but see that there are no air spaces left among them. It is always better to settle the soil with water if that is practicable. After the trees are planted, see that the soil is kept moist but not wet.

TAKE YOUR CHOICE.

Have you ever almost run into some one on the street, and then dodged from side to side for half a minute, vainly endeavoring to pass, while the other person by some strange fatality blocked your every move by trying to pass you in the same way?

Such was the recent experience of a young man in Portland Maine. He and a strange young woman had been going through this performance for several seconds, when his unwilling vis-a-vis staggered him by saying: "Well, hurry up! Which is it to be—a waltz or a two-step."—Woman's Home Companion for April.

A poor way to make the goal is to be pushed and boosted.

DAVIS INDUSTRIAL SCHOOL BILL.

We have received a communication from a leading agriculturist urging us to write our California Congressmen in support of the Davis Industrial High School Bill. The provisions of this bill we have referred to in a former number of this paper. It is strictly a measure for farmers' sons and daughters and one which would be valuable in the extreme to every boy and girl who does not expect to pursue a higher education than the high school. But should the student go through the university such an agricultural finish as the Davis bill contemplates would not come amiss, for it means education which may come good in after life, should agriculture be decided upon later, as is often the case with men and women tired of business turmoil at the end of a long and strenuous occupation.

President Roosevelt, himself an ardent admirer of the bill, gave utterance to a pronounced endorsement of agricultural education in a speech delivered last fall in Iowa, in which he said:

"We should strive in every way to aid in the education of the farmer for the farm, and should shape our school system with this end in view; and so vitally important is this that, in my opinion, the Federal Government should co-operate with the State governments to secure the needed change and improvement in our schools. At present there is a gap between our primary schools in country and city which must be closed, and if necessary the Nation must help the State to close it. Too often our present schools tend to put altogether too great a premium upon mere literary education, and therefore to train away from the farm and shop. We should reverse this process."

At the Whittier Farmers' Institute recently, we undertook to show that the trend of our present-day education is away from labor—not toward it, and as we must depend upon agriculture for our national prosperity and development, we should centralize our education along agricultural lines.

It will do no harm to rear a nation of boys and girls bred to agricultural pursuits. It may prove the apothesis of our national glory and our material safety as a people. The Cultivator heartily endorses the bill and likewise is pleased to read the numerous endorsements from the leading educational men of the United States, including favorable resolutions from many educational organizations, farmers' institutes, State colleges of agriculture and mechanic arts, commercial organizations, boards of trade, manufacturers' organizations and industrial organizations generally throughout the country.

Congressmen from California will do well to give the Davis High School bill their careful consideration to the end, its provisions may be carefully guarded and its disbursements economically administered.

DON'T WORRY ABOUT RAIN.

Although we are short about six inches in rainfall, measured by last year's precipitation for the corresponding date, there is no special reason for feeling uneasy. We are likely to have enough rain in April and May to answer all purposes for a good hay crop. Old residents of California tell us that we are in no immediate danger, and that a fall of two inches early in April will save the hay and also the vegetable crops. In fact, we have had some fine years when rain did not fall any more plentifully than it has this season to date, but we got late rains in April, May and June.

By reference to the rainfall chart of the State it will be seen that in former years we have had some prosperous seasons when we had little rain before the last of January. For example: In 1884, up to January 26, but four inches of rain fell, the most of that in October and December. On January 26 it began raining and by the 31st, when the storm passed, 3.15 inches had fallen. In February of that year the chart shows 13.37 inches fell. In March, 12.36; April, 3.58; May, .35; June, 1.39. That season the crops were good which were sowed early, but of course a great deal of land was unplanted, owing to the fact that it was too wet to plow.

There have been a number of seasons when the rains came very late, which produced fine crops, but they were scattered along and sufficient to keep plants growing. There is really no reason to worry yet, for there is time enough for all the rain we shall need to give us splendid crop results. It will be an exceptional year if this is not the case.

There is one feature in California farming which a few dry seasons will develop, and that feature is **DRY FARMING.** Of this we have treated often in the Cultivator but it seems almost necessary to be brought face to face with dry-season conditions to bring the dry farming methods into practice. When we learn, we can get along with half the rain we have, even in so-called dry seasons, and raise good crops, we shall learn that cultivation does more for plant life than rain without cultivation. Stir the soil often, stir the soil deep, stir the soil oftener than anything else, is the basic principle of dry farming and the whole element of success. When we learn we can retain moisture by cultivation we shall cease to worry about the amount of rain which falls from season to season. This proposition is State-wide and general in its effect and applies with equal force in Central as well as in Southern California. Northern California never worries about scarcity of rain. It's God's country so far as nature's showers are concerned.

The Pacific Rural Press is of the opinion that dairymen will not be able longer to lay the blame for poor milk on the dumb cow. The milkman must get busy and mix his cows to bring up the test of the milk. Beside helping the milk, it may help the poor cow, says the Press, as it does some other organisms, to be in good company.

V. L. L., San Jose, says: "I am sure the Cultivator is well worth the price, and would say I could hardly be without it if it were double the price."

FIX UP THE SCHOOL GROUNDS.

There is no place in the world little time spent in improving the grounds a house will show for more than in Ca And there is no country so favored which more neglect in this respect than Ca What is applicable to our houses is dou ticeable to our country school grounds once in a hundred times do we find a where the grounds have received any at They are bare, neglected and distressing upon. We do not have to go to the rural away from the town, or city, to find th dition, for it exists everywhere. Not onc hundred times do the trustees or the pat our schools take an interest in how the bu or the grounds look, for as a rule, the people do not appreciate the value of the as they should. There may be some exc our city schools because the expense of ing large grounds is often so great that it be afforded. But in the rural districts th back is not felt. Usually an acre is secu this is ample for all purposes. It would easy matter to lay off the grounds so tha beds could be made on them without int with the room needed for exercise. Then easy matter to plant trees along the line which will afford shade for the childre at play or during the noon recess. And different aspect these slight improvemen impart to the place, and what a differe the teachers and children would have a

A great many teachers in rural scho like to improve the buildings and grou they are helpless because they receive couragement from the farmers or their who are directly interested. There are a many children, too, who would gladly as the work of making flower beds, and in for them, if they were given the opport There is a great deal more of refining in in a child than we who are older realize, b often there is no chance given for the dis that sentiment. What we ought to do wo to encourage our children in early life to their desire for the beautiful and to afford an opportunity to receive correct ideas wonderful secrets of nature. One thing w to remember: no teacher, nor pupil, can best work in a dilapidated school building neglected surroundings. When we come preciate that there is a lot more to than what is gotten from text books, w understand better the value of our rural schools. Pupils imbibe careless ideas and ly ways from dirty school buildings and ne surroundings. The woman's clubs of Cal can do no better work than to inaugu campaign for improving rural school bu and grounds. It would be a work which tell everlastingly on the habits of the bo girls and make for good along the lines of education. The question is, will they in such a campaign?

WE ENDORSE IT.

We have heretofore made mention ruling of the Postoffice Department in r to arrears in newspaper subscriptions. this ruling "unless subscriptions are expr renewed after the terms for which they within the following periods—weeklies, one year; they shall not be counted in the imate list of subscribers."

The better we come to understand this the more we approve of it. It will work ship to the legitimate publications and it purge the mails of fraudulent, so-called new pers which are published simply as advertis mediums. The only wonder is that this or has not been made long ago. Hundreds of of illegitimate second-class matter have burde the mails, costing the government large sums, vi timizing legitimate newspapers and hundreds thousands of innocent recipients who were ca ried on the books of such publications and to mented by dunning notices or the persistent in portunities of soliciting advertising agents. U der the new rule all this will cease and the new paper business will become a respectable, ho estly conducted enterprise. We endor th new rule.

THE CALIFORNIA HEN.

I have read of Maud on a summer day
Who raked the sweet alfalfa hay;
I have read of the maid in the morn.
Who milked the cow with the crumpled horn.

I have read the lays the poets sing,
Of the rustling corn and the flowers of spring;
But of all the lays of tongue or pen,
There's naught like that of the California hen.

Long before Maud had raked the hay,
The California hen commenced to lay;
And before the milkmaid had stirred a peg,
The California hen had laid an egg.

The corn must rustle,
The flowers must spring,
If they hold their own
With the barn-yard ring.

If Maud is in need of a Sunday gown
She doesn't hustle alfalfa to town;
But she goes to the store and buys a suit
With a basketful of fresh hen fruit.

If the milkmaid's beau makes a Sunday call,
She doesn't feed him on milk at all;
But works up eggs in a custard pie,
And stuffs him full of chicken fry.

And when the old man wants a horn,
Does he take to the druggist a load of corn?
Oh, no! He simply robs a nest,
Takes the eggs to town—you know the rest.

He hangs around the courthouse ring,
Talks politics and other things,
While his wife stays at home and scowls;
But is saved from want by the self-same fowls.

For while her husband lingers there,
She watches the cackling hen with care;
And gathers eggs, and eggs she'll hide,
Till she saves enough to stem the tide.

Then hail all!
The California hen.
Throw up your hats and emit a howl,
For the busy, persevering, useful fowl.

Fruit may be king,
But it's plainly seen
That the cackling hen's
The California queen.

—Ex.

WHITE DIARRHEA OF CHICKS.

As the warm season approaches and we begin to get our yards filled with young chicks, we should take every precaution to prevent what is considered the most dreaded disease known to poultrymen. Many poultrymen say that where the disease prevails it kills from 60 to 75 per cent of all chicks hatched, and that when it once gets a start it is very hard to control.

In a Bulletin No. 128 issued by the Bureau of Animal Industry, U. S. Department of Agriculture, by Geo. Byron Morse, M. D. V. S., which we print herewith in part, more stress is laid on the prevention than the cure. We would advise our readers, if the flocks have been troubled with "white diarrhea" to follow the direction given here. Try to prevent disease as it is almost an impossibility to cure chicks after they are attacked with it.

Dr. Morse Says:

"White diarrhea of chicks," began to come into the laboratory, and microscopic examination of the contents and walls of the greatly distended and necrosed ceca or blind intestinal pouches, brought to light the destructive invasion of the lining cells by this minute but malignant microorganism.

Accurate researches in subjects of such wide reaching import necessitate much time in experimentation in order to establish all points involved in a successful war against so subtle a foe. However, the pathological division is receiving, from both scientists and poultrymen, numerous letters asking for the func mental facts of our investigatio and it hardly seems just to w hold this knowledge pending t carrying out of experimental stu many of which could be undertak on a far larger scale by poult plants and experimental statio Hence this preliminary report.

Description of the Disease.

White diarrhea (typhlitis coc diosa) of chicks is an inflammati of varying severity of the ceca, blind intestinal pouches, caused the presence of Coccidium tenel an intracellular parasite belong to the class Sporozoa, of the phyl Protozoa, the lowest division of animal kingdom.

This disease claims as its vic mostly chicks between two and weeks of age. The symptoms dullness and weakness, accompa by a white, pasty, fecal discharge. this discharge may often be det by the microscope large numbers circular, sometimes slightly o cysts 12 to 15 microns in dia containing granular matter may fill the cyst or may be tracted to occupy only a small tion of the cavity. These are permanent cysts of Coccidium te lum. Post-mortem examination veals the blind pouches, or ceca, r markably distended and packed w a yellowish white, cheesy materia which sometimes exudes into the abdominal cavity through perforation in the cecal wall. Examination o this necrotic material shows so permanent cysts, and in the scrapings from the inner wall of the c cum, placed under 'the microscop are to be found epithelial cell markedly distended by the invasion and development within them of this parasite. This invasion of the cell results in its final destruction and separation from the wall which it forms the lining; it then becomes a constituent element of t pasty catarrhal exudate which ch acterizes the feces in this affect In many cases the lungs show t same necrotic change, in some stances the entire lung being tr formed into a solid yellowish w chessy mass. This appears to the so-called bhooder pneumonia.

Coccidium tenellum is freque y found in the intestines (especial the ceca) of chickens of all a Thus the droppings contain the permanent cysts which require on warmth and moisture for their development into sporozites by which th disease is transmitted to other bird When received by chickens into their digestive tract in food or grit soil with infected droppings, the c wall bursts or is dissolved and th sporizites are set free. These penetrate into the epithelial cells, where they grow to great size as schizont, causing thus the destruction of the cell.

Treatment.

Treatment of coccidiosis in chicks is almost futile. An attempt might be made by the use of calomel, one-tenth of a grain, or a few drops of castor oil containing 1 to 3 drops of turpentine. Along with this, 5 to 10 grains of sulphate of iron (copperas)

should be dissolved daily in one gallon of drinking water.

Prevention.

The essential work in battling with this disease consists in prevention. This must begin with the eggs used for hatching. These should be thoroughly and antiseptically cleansed by wiping in 95 per cent alcohol. If artificial incubation is used (and in this method lies the great hope of success,) the incubator if used, before, should, previous to receiving the eggs, be carefully washed with antiseptic solutions and exposed to the sun. The egg tray should be scalded or flamed. The floor of the nursery should be movable, so that it may be taken out and sterilized, and if made of burlap the old piece should be torn off and a new piece mounted on the sterilized frame. The same precautions should be used with the brooders. The soil to which the chicks have access should be well covered with lime, dug up and exposed to the drying effects of sun and air. With all the foregoing precautions, absolute freedom from the disease cannot be guaranteed without further experimentation. At least one German investigator has found the coccidia in the white of the egg and in the shell, which has gathered them up in the passage of the egg through the cloaca.

If natural incubation is practiced, the hen for a week or two before being set should be treated with one-quarter to one-half grain doses of sulphate of iron daily, with occasionally an active purgative, such as calomel 1 grain or castor oil one-half teaspoonful containing 5 to 10 drops of turpentine. The eggs, cleansed as directed above, should be placed in a perfectly fresh nest, which may be sprinkled from time to time with a little lime. After hatching, the hen with her chicks should be placed upon ground that has been thoroughly sterilized, as described above, and at least every few days moved to fresh ground which has been treated in the same way and from which all chickens have been debarred.

AROUND THE YARDS.

Cleanliness in yards, coops and houses is a necessity.

* * *

Feed well, keep the chicks growing. Early maturity means winter eggs.

* * *

It is not a good plan to yard chicks of different sizes in one yard; the little fellows will get the worst of it.

* * *

No matter how good your parent stock, unless the chicks have proper treatment they will never develop prize winners.

* * *

Poultry for pleasure is all right for a while, but it soon gets monotonous. A flock that lays and pays is a real pleasure.

* * *

Now is a good time to look for ilce and the "little red mites." Don't let them get a start. They don't like paint and whitewash.

* * *

Wm. Starbuck of Fullerton has a Barred Plymouth Rock hen a year old with a record of 172 eggs in seven months. Up to the end of the fifth month her record was 151 eggs. Mr. Starbuck says this is the best record ever made in the world, and that 200 a year is a good record. The little hen is still making good every day and at no time has she

Coulson's
Growing Chick Food

After hatching your chickens and raising them successfully up to 5 or 6 weeks old, they are worth something to you, and every one that dies now is a distinct loss in the cost of feed you have used, as well as the cost of hatching and subsequent care of them.

Therefore, in deciding what feed to use now that they are getting too large for the baby chick food, you must exercise the same care as before, to give them the best.

The Best Feed with the Least Labor

Is what you want and that is where

Coulson's Growing Chick Food

comes in.

Coulson's Growing Chick Food is rich in protein, owing to the meat and bone it contains. The grains and seeds in this food are not all ground up, a portion being granulated, so as to give their digestive organs sufficient work to insure health. The food contains a large variety of ingredients, which furnish the growing chick all it requires for quick, healthy development.

COULSON'S GROWING CHICK FOOD is especially adapted for feeding dry in hoppers, as well as dampening as a mash.

THE HOPPER STYLE OF FEEDING HAS NUMEROUS ADVANTAGES:

COULSON'S GROWING CHICK FOOD can be placed in a hopper in sufficient quantity to last for several days. If this hopper is properly constructed there will be no waste, and the consequent saving of labor in feeding is large. The chickens thrive amazingly well on it, and are kept in the most healthy condition, as with the dry feed always with them, they have no desire to gorge, with consequent digestion troubles.

Many have hesitated about trying this method of feeding by reason of the cost of the hoppers required. A good hopper for dry feeding can be made by any one at a very slight expense. We will be pleased to furnish a simple method of making these hoppers, free of charge to you.

Try the Dry Feed Method

with

Coulson's Growing Chick Food

and we are sure you will never use any other.

COULSON'S GROWING CHICK FOOD can be used for chicks from 4 to 6 weeks old up to 3 months old, when COULSON'S EGG FOOD or IMPROVED MASH EGG FOOD should be fed them.

If your dealer does not handle COULSON'S GROWING CHICK FOOD, write to us and we will tell you where you can get it.

Starbuck's Barred Plymouth Rocks
We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are layingfine. We have divided into pens according to the way they are showing up in six months laying. $2.50 for 13 eggs from first pen. $1.00 from 2nd. until they have time to make longer records. (Except from our one best, not for sale. We claim the world's Barred Rock, 6 months laying record for this one.) Do you wish to hear about our prize winning Buff Orpingtons and Silver Wyandottes? We have something to crow about. No Sunday sales or visitors.
Wm. Starbuck & Son. Fullerton

tried to throw up her job to "set."

* * *

The results of over-crowding are, or ought to be, sufficient to prevent any right-thinking person from practicing and propagating the abuse. In the first place, it is an act of cruelty to the fowls, and, whether this over-crowding takes place in the hen house or in the runs, the results are equally disastrous, as birds kept in such unnatural conditions cannot be other than diseased and neither they nor their eggs are fit for consumption; and yet when we come to think of it, who can say how many thousands of such eggs find their way into the markets every year?

DUCK RAISING AS A BUSINESS.

To the average observer the sight of thousands of ducks is one not to be forgotten. At the same time there is no poultry establishment where visitors are less desired than on a large duck farm. The Pekin duck is probably the most timid of all domesticated ducks, and strangers, as a rule, are prohibited from visiting on this account, as all stampeding, scaring or otherwise disturbing the ducks cause loss in flesh, vitality and profit.

Firmly Established.

The duck business of today is probably one of the most firmly established profit-paying branches of poultry husbandry. But there is no branch of poultry farming where failure is so certain when proper methods are not followed. It requires a large outlay of money, and an extensive and varied experience. It takes time to develop a market and to know when and where to ship the product to advantage. The person who has the chance to visit a large duck plant should consider himself fortunate in the chance to see how ducks are raised on a large scale and on a profit-paying basis.

Long Island has the reputation for ducks, and here and there over the Eastern States are to be found a few duck farms of considerable size. In other parts of the country very few large duck farms are in evidence. Hundreds of thousands of ducks could be raised in this country in excess of those already produced, and still not over-supply the market. There are numerous places where they could be raised and disposed of at a profit.

A Little Work.

While one of the most profitable branches of the poultry business, there is plenty of good hard work connected with it, as I know from practical experience. It means early to rise and late to bed if you expect to realize a fair profit. The ducks will be up and ready for their morning feed as soon as it is light, and it is not good policy to keep them waiting long, as it will cause them to fret off good flesh, or will affect the egg yield. From the beginning of the hatching season until the last batch for the season is ten weeks old, the caretaker must work early and late.

When Pekin ducks were first introduced, numerous persons went into the business with little or no experience, expecting to get rich in a hurry. Prices then were high and, naturally, values declined, because it takes time to create a demand for a new market product, and in consequence "green ducks" could scarcely find purchasers at any price.

Good Prices.

But during the spring months, in the New York and Boston markets, "green ducks" bring from 20 to 35 pound at wholesale. The greatest demand and produc June, July and August, when average 15 to 20 cents per wholesale. The lowest pri these ducks have brought in in New York and Boston mar cents per pound, while the h record is 35 cents. Remem are all wholesale prices paid mission men. The retailer g 10 to 15 cents more per pound grower.

The census of 1900 shows number of ducks (all kinds) r nually in the United States 807,358, and during the pa years has been greatly incre pecially in the eastern state more ducks are being raised e for the New York and Boston whose demands are hard to s Michigan Farmer.

BUILDING UP THE SIZE VIGOR.

I have had White Leghor years. I selected this kind of their beauty and utility, c with noble carriage and othe able traits. I long ago det to try to produce a larger fo the standard type of the I family. This I succeeded in by constantly and carefully eggs for hatching from my v specimen birds only, and al ways breeding for points. short course of experimenti above line, I began to obtain sired results. My fowls i materially in size, while at t time my constant selection best laying strains among my kept showing a steady incre egg production that was most fying. Now after these years tient work I find that I have a that is unexcelled in the points of increased size of bo laying qualities. Of course I d claim that all my eggs hatc perfect chicks but that the g average shows a decided gain in the direction of size of bo prolific laying qualities.

You requested me to give a ment of my method of care and etc. I have my ranges in my orchard, where there is ple good room and shade in hot w I keep the houses perfectly cl feed only good, sound gra fresh, sweet mill stuffs, ther curing the highest quality an both of eggs and poultry f use. I find also that by us such grains as above stated, are far stronger in vitality a hatching percentage than eg duced by equally good hens manner of rations, some goo sour and mouldy, such as is t supplied to laying fowls; thi point that I am sure deser attention of poultry raisers. a supply of all kinds of grit before my flocks, and fresh water is not neglected; gree is fed regularly and modera winter. Instead of using str scratching purposes I provide sharp sand, which I find pre ra to straw from a sanitary poi view.—Mr. Rittenhouse in R ral N Yorker.

Actual pleasure and culture may found in the humdrum duties every day life if they are done in t right spirit and with the determin tion to do everything in the be possible time and way.

CARE OF CHICKS.

l give my method of caring le chicks, which I find to be l for me.

Boiled egg, ed fine, is excellent for them. should have a feed of green and meat scraps once a day. must be fed often, about five a day, until they are ten days hen three times will be suffi- Feed what they will clean up minutes. If any is left, re- it. Have a wire-covered run nt of the coop, and in this scratching material and scatter iety of grains (cracked corn, and millet seed is best) in it, keeps the little fellows busy, them exercise. They should d dry feed, as I find from ex- ce it will give best results, as is not as much danger of feeding. They should have an occasional feed of ground green bone. As to amount to feed, one has to use their own judgment, but never feed more than they will clean up.

Don't forget to keep a close watch for lice. Dust the chicks often and keep the coops and runs clean. Lice are often the cause of the so much dreaded bowel trouble among little chicks. The only way to fight lice successfully is to be on the lookout for them every day.

Keep the hen confined in the coop until the chicks are a week old, then on bright days she can be let out for a while. When the weather is warm let them go most of the time.

Success in caring for chicks is good care each day. They do not need any coddling, as a great many think. What they need is a good, warm place to roost. Keep them free from vermin, giving them clean, fresh water to drink and good wholesome food to eat, with plenty of grit. Supply these and you will find the care of little chicks a source of pleasure as well as profit.—Commercial Poultry.

FEEDING CHICKS.

It is my opinion that a great many chicks are killed or injured by feeding too soon after hatching, says a writer in Country Gentleman. Some breeders seem unable to wait until the chicks are all hatched out before they give them something to eat. Twenty-four hours is none too long to wait before feeding the first time. Thirty-six to forty-eight hours will, in many instances, be better.

Then, when you start them in, give only good, wholesome food. Avoid wet, soggy food. Many chicks will live on such food; some may thrive and do as well, apparently, on wet corn meal as on anything else, but this does not prove that it is best for them. Bowel disease has carried away a great many promising broods of chickens, but this trouble does not always come from feeding the chicks too soon, or from improper food. It will sometimes show itself when they have had the best of care and food. It was stamped on them when they hatched.

For the last few years, I have fed everything dry, and, as a result, have lost a much smaller percentage of chicks from this complaint. Some seasons almost every hatch will show more or less of this trouble. In such a case, I attribute it to the breeding stock or to the incubating, more generally to the breeding.

IN DUE COURSE.

The learned old German scientist would not, under any circumstances, hasten his exceedingly deliberate speech. And when he spoke English he was particularly careful of his words. He was in a Baltimore restaurant and of course ordered oysters. A plate was brought glistening with oysters on the half shell. They could not have been more attractive.

"I cannot eat these oysters," began the German in a measured tone. The waiter hustled the dish off and soon reappeared with a second appetizing plate.

"I cannot eat these oysters," began the German again in calm, measured cadences. The waiter hurried away and returned with a third dish. "I cannot eat these oysters," said the German.

"Why, what is it, sir?" asked the waiter, this time pausing for a possible explanation.

"I cannot eat these oysters, because you have not provided me with a fork."—National Farm.

NEW SMALLER SIZE DE LAVAL CREAM SEPARATORS FOR FAMILY USE

The new 1908 Improved De Laval Cream Separators are made in ten different styles and capacities. There is the proper size machine to be had for every dairy, from that of one cow to one hundred or more. In this connection special attention is called to the new smaller size De Laval machines, which are now offered for the first time, and have been designed for small family use where the milk of one or two cows only is to be separated, and also for hotel, restaurant and city home use, where purchased milk may be creamed or clarified to advantage. These little machines do just as good work as the larger ones and will save their cost in less than a year. The prices are, of course, in keeping with the sizes of these small machines, bringing them within the reach of all and removing all possible objections to the purchase of a first class separator on account of the cost. A postal card will bring our handsome new catalogue describing and illustrating these latest additions to the De Laval family. Write today, for every day you are without a separator you suffer an actual money loss, even if you own but one cow. At least let us show you the many important De Laval improvements that have been made. You are not obliged to buy and you may learn something to your advantage.

SUMMER CROPS.

THE days grow longer and the heat strengthens until the time comes to sow sorghum. Sorghums are of two classes the saccharine and the non-saccharine types. The more familiar non-saccharines are Egyptian corn, Milo maise, Kaffir corn and the detested Johnson grass. The first three come in well for catch crops. The last is a gay deciever that appears well, but becomes a knave, in that it will not depart and will not make a complete stand of itself. Even the Bermuda does make good summer returns for the land it takes. Egyptian corn is the most sown of all catch crops. The red variety is the most popular one in this part of the valley. The white form affords abundant growth of stalks but the seeds are not well protected in the head. The birds harvest it readily, the dear little dickey and dollie birds make havoc with the grain portion. The red variety is not as palatable to them and pretty well protected in the heads so it suffers much less from the birds.

Fodder.

The stalks of Egyptian corn are not relished by dairy cows; they will reject too large a proportion to make it a profitable fodder crop. Kaffir corn affords more abundant leaves and makes a fair fodder crop when sown thickly in the rows. The objection we have found to it, is not as a feed but as too expensive to remove from the land. We have too little frost and rain to help us get the roots out of the land. One field of extra rich land gave a heavy crop and seemed to pay well until we found it necessary to put on eight horses and a tree digger to cut out the roots before they could be turned out with the plow. They had then to be hauled off the land; the dump was in a sink hole and three years afterwards they were at last burnt up.

Saccharine Sorghums.

In cultivation the various varieties are all of the one type. The seedmen have brought the same plant from different countries of the world and given it various names. The standard variety is the Early Amber. Its two most valuable qualities are that it will grow in alkali land that would not raise Indian corn, and that it can be sown at almost any time in the summer. After the Indian corn is well started we turn to sowing the sorghums. In sowing the field it may be preferred to broadcast the seed and harow it into the ground. We find it preferable to drill it in rows. The weeds can then be kept down and the sorghum can be irrigated. The use of water naturally will increase the yield many fold.

Soiling.

When the sorghum has reached the second joint, it may be cut for soiling, by setting the mower high enough to leave the first joint next to the ground; the same root will send up new tops until the growth is checked by frosts. About half an acre to a cow will give abundant food for the herd. This it will do with the minimum of growth, with the usual growth there will be much to spare. Whenever there is more sorghum than the cows can eat, begin to make it into hay. The making of this hay has to be watched. After two or three days in the windrow the leaves ar into small cocks. These coc watched and opened and turn side out at least once during t ing process. The hay should and mellow not rattling dry finished. The colt and pigs ar as fond of this hay as the cattle

Sandwiches.

Where straw or foxtail hay had cheaply enough, a sorghum wich is easily prepared. It mal acceptable change in the fall a ter feed of the cows. A layer thick of the hay or straw is p the ground, then a foot of the fresh cut sorghum, then another of hay. The sorghum is always a foot from the edges of the The stack does not have to be at once, but a layer every othe will answer, remembering the must be the dry stuff. The should be planned to be not less twelve feet high. The very to made of two or more feet of the or straw rounded and raked o shed the water like any other fo hay stack. When the stack is out it is cut down from an end a hay knife. This stack when with alfalfa hay will keep the lightly worked stock rolling it is very nearly a balanced rat

Sorghum.

Sorghum forms a dense shade can be used to smother Berm grass. The Bermuda sod is broken the first rains and turned on e not thrown clear over, then after couple of weeks it is set on fire, a all is burned that can be, it is ra over and the piles again burnt. B ley is then sown thickly on the la cut early for hay and the land ir gated and again plowed for sorgh burning any Bermuda roots that c be raked up.

The odd corners not covered w the smother crop must be kept ra and burnt off. On ditch banks where the land is not desired for c tivation, after the tops are hoed a liberal soaking of crude oil often make an end to the Berm This way of destroying this pest this to recommend it, that whil are smothering it out we are st curing some returns from the l

Pumpkins.

Pumpkins should be sown in e odd corner; a little hoeing and haps a bucket of water will b them around into a good profit. T are a hardy and profitable crop that quires little expenditure to produc good return. The love the cows h for pumpkins is almost as great darky has for watermelons. The p and colts also relish them when th are chopped up for them in the fi The chickens find good egg food in t yellow flesh of a sound pumpkin W have many every year that wo make Cinderella a fine coach to go to the ball.

Pie Melons.

Once sown these come up year after year so that a ptach is self-sustaining; like watermelons they seem almost to grow themselves. The principal use of these is to furnish succulency to the pigs' food. Cows rarely can be induced to eat them, so they are only grown in waste places. While these crops given do not suggest a wide range, still as all are abundant growers they only need tc ɔfully studied to make dairy ɀ a success. We fail constant- the little things in California. ıch land, too much waste and ch neglect of a crop after it is brings up our losses to a high It takes a lucky year to pull debt and a couple of bad ones he average farmer paying all nings to the bank. The utiliza- f little things is when we learn ne of our great lessons in life stered. RPLEXING HOG DISEASE.

swine industry in Colorado is ed by a disease which we have eard mentioned in California, may be well for hog breeders ow of its existence.

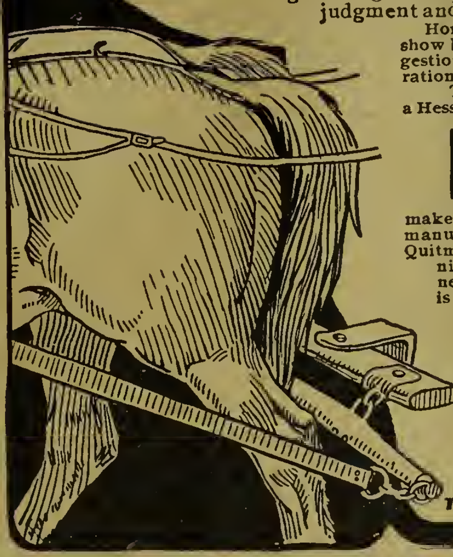
a recent interview Dr. Geo. H. r head of the Department of nary Science of the Colorado iltural College, at Fort Collins, hes the fololwing timely ad-

e raising of hogs promises to ıe of the great industries of ado. It does not take long to good-sized herd of hogs; it often less time to get rid of them, if ıne of two or three diseases gets g them.

various points in the State a e has made its appearance g hogs which has caused some and much apprehension on the of hog raisers and those who contemplated going extensivelly the business. The disease is ıratively a new one. It is n to be caused by a specific which is found in the litter n everything with which dis- animals come in contact. The l business of this germ seems to cause gangrene. In nursing ttle pigs irritate the nipple of ıother. The inflamed places are ed by the germ and the little then become infected from the :r.

e first thing usually noticed is e small pigs, which become and emaciated. Examina- of the mouth reveals the pres- of large, sloughing areas; often eeth fall out. In some cases will be a cavity extending gh the snout or the lower jaw.

here the germ often invades ntestinal tract, causing ulcers, ı perforate the bowels. The ıe is found distributed over the to such an extent that local ntine laws seems of little avail. perplexing part of it is that it is associated with hog cholera the report to this effect has us an unenviable reputation. disease, when not associated hog cholera, can be checked. most every case the farmer sits and does nothing. In a few good money is paid out for nostrums. This disease has ne a very serious matter, but not necessarily menace the hog stry. Lethargy, combined with knowing how, has in most in- ces resulted in the farmer losing is small pigs and many of the r ones. In the vicinity of Fort ns there is evidence of this dis- and in a few instances it is



Tons Of Energy

In Pounds of Feed

Working energy in the horse is much like steam in an engine—both are developed by economical fuel consumption. If, then, the digestive apparatus of the horse extracts from its food the full amount of nutrition which can be assimilated, he is certainly in the best nurtured and most vigorous condition for hard labor. Now digestion in the horse may be easily deranged, because he possesses a small stomach and high-strung nervous system. Hence heavy feeding requires judgment and instant correction of the first wrong symptom.

Horses receiving regular small doses of Dr. Hess Stock Food show best as drivers or workers. It corrects a tendency toward indigestion and strengthens the organs up to a point where the largest amount of ration may be assimilated. It increases appetite so that the horse takes food with a relish.

This is especially important in the case of a beef animal, and experience shows that a Hess-fed steer will eat more roughage and fat on *less grain* than an animal not so handled.

DR HESS STOCK FOOD A TONIC

makes good digestion and good digestion saves nutriment which would otherwise go to the manure heap. The ingredients in Dr. Hess Stock food are endorsed by Professors Winslow, Quitman and Finley Dun, our most noted medical writers. It holds iron for the blood and nitrates to cleanse the system. It makes cows give more milk and shortens the time necessary to fat a market animal. It is the prescription of Dr. Hess (M. D., D. V. S.) and is *sold on a written guarantee.*

100 lbs. $7.00; 25 lb. pail $2.00

Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal preparation and this paper is back of the Guarantee.

FREE from the 1st to the 10th of each month—Dr. Hess (M. D., D. V. S.) will prescribe for your ailing animals. You can have his 96-page Veterinary Book any time by asking. Mention this paper.

combined with cholera. The following steps are advisable: If your hogs are healthy, establish a quarantine. Be careful about bringing in any unhealthy animals and do not allow your neighbor to bring the infection in on his boots or come there with breeding animals. If the disease is already with you, get busy.

"In the first place, kill all animals that are badly affected; then take away all the healthy animals and put them on healthy ground by themselves. Disinfect the premises by burning all refuse. Use whitewash, zenoleum, carbolic acid, and other disinfectants freely. And, most important of all, pick up the little pigs and dip them in a tub containing a solution of potassium permanganate, one ounce to a gallon of water. Watch the mothers carefully and see that the little ones are not in danger of infection from nursing. Animals with this disease will not be passed for food by the local food inspectors. Therefore, it behooves the butchers to be on their quard in purchasing hogs for the block."

GREEN FORAGE FOR HOGS.

An especialy timely bulletin has just been issued from the Missouri Experiment Station by Dean H. J. Waters giving the results of some experiments to determine the value of different forage crops for hogs.

Thirty-six pigs weighing about 50 pounds each were fed in lots on different forage crops in connection with corn until they were ready for market, accurate account being kept of the cost of gains made.

In cheapness of gains the feeds used ranked as follows: Corn and skim milk, cheapest; corn and alfalfa, second; corn and red clover, third; corn and bluegrass, fourth; corn and rape, fifth.

A saving of about 75 cents a hundred in the cost of gain was effected by using green clover instead of fresh bluegrass. A saving of $1.00 a hundred was effected by using alfalfa instead of bluegrass.

When it is realized that alfalfa comes on early and when properly clipped stays green all the year, its importance as a hog pasture is apparent.

Clover yields more forage per acre than bluegrass, and as shown by these experiments has a much higher feeding value. It is of the utmost importance, therefore, to provide this sort of pasture for hogs.

Keep the weeds down by shallow cultivation while the plants are small. Conserve moisture where necessary by prompt shallow cultivation after each rain. When one cutting is made, stir the ground to promote new growth.

Any little improvement in dairying that will cheapen the cost of the production will sum up the same as an increase in selling price.

To get the maximum of milk which the cows are capable of producing, there must be not only good feed but even management.

It does not pay to let the milk cool before separating. It means a definite loss of butter when it goes to the churn.

Bad ventilation in the dairy house will sometimes cause the butter to be pale, as well as letting it get too sour.

HISTORY OF SEWING IMPLEMENTS.

In the British Museum are the oldest scissors known. They are made of bronze and are centuries old and are of very substantial workmanship.

During the long centuries that have elapsed less changes have taken place in scissors than in any other article used in sewing. Out of the bronze sprang those of silver, gold, brass, iron, steel and, in later years, aluminum and nickle.

The forging of steel scissors involves much hard work, and the cost in the United States is so great as to prohibit competition with England or Germany.

The needle of today is an instrument used to carry the thread in sewing, embroidery, knitting and other similar operations. They are generally made of metal, but bone, ivory and wood are also used. For ordinary needlework they are made of fine steel, and for other kinds of work they are often much larger and differently formed.

The earliest needles were not pierced, but were like awls and were used for making holes in skins through which the long roots of plants were passed. Later, a hole was bored in one end of the stone or bronze needle through which the root was passed, and this was dragged through the leather as it was punched.

Ordinary needles and surgeons' needles have been found in the ruins of Pompeii. The Chinese were believed to have been the first to use needles of steel.

Buttons were used only as ornaments until the eighteenth century, when coats came into style. Centuries ago, before metal was first discovered, twigs, sharp-pointed fish bones and quills were used to fasten garments. The materials for making buttons are numerous, earthenware and porcelain being the chief. These buttons are shaped and baked in kilns. They are the cheapest, selling as low as 25 cents per great gross. These are made almost entirely in Europe, where labor is cheaper than in the United States. Buttons are also made of walrus and elephants' tusks. These are carved by hand and are very expensive. Pearl buttons are always in demand and are cheaper now than formerly. These are made from pearl shells obtained in deep waters off the coasts of Australia and the Philippines; also in the Indian Sea.—Rebeca R. Boswell, Instructor in Domestic Art, Colorado Agricultural College.

Gladioli delight in a deep, rich, mellow soil, plenty of water and full sunshine. Plant in groups. To do their best when potted they require warmth and good drainage.

ALMOST PERPETUAL MOTION.

A Los Angeles paper recently contained an article from which we take the following:

"Perpetual motion is apparently demonstrated at a pumping plant installed by W. I. Hollingsworth & Co., on their Lomita tract, which is located on the main road between Redondo and San Pedro. In an effort to devise a plan whereby the natural gas bubbling up through the water could be disposed of, a hydraulic engineer discovered a method to utilize it for fuel. It has proven a distinct success and the unique spectacle is presented of a huge engine pumping water and gas from a 600-foot well and transforming the gas into units of energy."

This plant was devised by W. H. Frost, of the Western Gas Engine Co., and is, indeed, a remarkable machine.

"The pump is pumping itself," exclaimed the enthusiastic engineer, G. M. McIntosh. Although a little distillate is used in connection with the gas at the present time, later it is expected that more than enough gas will be generated to run the entire plant, and furnish light as well.

"Gas was first discovered when one of the workman touched a match to the discharge pipe," stated Frost yesterday. "Its presence explained the failure to get satisfactory results from the pump. The problem was to get the excess of gas out of the mixture so as to handle both the water and the gas. The well was drilled to a depth of 680 feet. There was a fine flow of water. But as soon as the pump began to work, it developed one-fifth volume of gas, making it impossible to pump the water. I installed a device for getting rid of the surplus gas. Then the pump, which is a centrifugal two-step Eclipse, worked to perfection.

"Next the mixture of gas and water was pumped into the separator and converted into spray. The gas, separated from the water, was led back to the engine room, and the water poured through a flume into the reservoir."

An analysis of the gas shows it to be a hydro-carbon of 800 British thermal units.

Since its successful installation, a number of pump experts have visited the plant to witness its operation.

FARMERS NOT HOSTILE TO MOTOR CAR.

It has become the fashion among some writers and not a few motorists to credit the farmer with a feeling of animosity toward the automobile. In the New York to Paris race some of the drivers complained that the "Peasants," as they called them, charged exorbitant rates for the assistance rendered the snow-bound machines.

G. B. Sharpe, publicity manager for the Studebaker, stated in a recent interview that his own experience with the Studebaker Army Dispatch Car that made the run from New York to Fort Leavenworth, Kansas, most of the way over the same route, would lead him to an entirely different conclusion regarding the farmers' attitude.

Said Mr. Sharpe: "The farmers helped us to dig through snow drifts and brought their horses out to assist us through drifted roads where ordinarily a farmer would not think of asking his horses to go and, considering the service rendered, I do not believe their charges were exorbitant. Furthermore, many of them exhibited an enthusiasm that was, to say the least, cheering to our tired drivers and crew. All along the line our drivers reported the same kind of treatment, and nowhere were they more enthusiastically welcomed than in the great farming State of Kansas."

COTTON SEED FOR THE ASKING.

A sample package of an improved cotton seed will be supplied by the Johnson & Musser Seed Co., of 113 N. Main St., Los Angeles, to all who apply before the supply is exhausted. Those wishing to experiment in cotton growing should write at once for this seed.

Western Gas Generators

The most reliable and cheapest GASOLINE GAS GENERATOR ever put on the market.

For Lighting, Cooking and Heating. This Generator is used by the largest hatcheries in California for Incubating and Brooding.

AUTOMATIC, SAFE, ECONOMICAL.

Read what Mr. A. W. Foster, President of the California Northwestern Railway, has to say about them:

Gentlemen: Replying to yours of the 20th inst., I would state that the plant installed for me by the Western Gas and Power Company on my Hopland Stock Farm, is giving entire satisfaction, and I cannot speak too highly of it. Yours truly,
A. W. FOSTER.

Mr. Foster used an acetylene gas generator before we installed our Western. Send for our latest Booklet.

Good reliable Agents wanted.

KEEP TROUBLES TO YOURSELF.

Keep your troubles to yourself;
Put them on an upper shelf;
Far away as it may be,
Where no eye but God's can see.

Other people have their share
Of affiction, pain and care;
Why should you, though sorely tried,
Burden them with yours beside?

Daily brooding o'er your grief
In no way affords relief,
But intensifies the smart,
Turns the arrow in the heart.

Think of others who have known
Greater sorrows than your own,
Keeping all their wounds concealed,
Heroes on life's battlefield.

Give of treasures you posses,
Loving care and tenderness,
Cheerful smiles or sordid pelf,
But keep your troubles to yourself.

THE GIRL PILOT.

"TELL me the worst," said Phoebe, bravely. "I know it's bad or you would not look so serious, Mr. Stark."

The little lawyer fidgeted in his chair. He hated above all other things to be the bearer of bad news.

"Don't be afraid," ran on Phoebe, to put him at his ease. "Is it ten thousand?"

"Less than that," said Stark, slowly.

"Only five?" she asked, with an attempt at a laugh; "four, then?" she added, as the lawyer remained silent.

"There is nothing left," said Stark, sadly. "After the settlements are made there will be between $300 and $400. Of course, the tug will bring something, but at a forced sale little can be realized."

"Sell my namesake!" cried Phoebe, "sell the last of the Ryerson fleet? Why, I should as soon think of selling mother."

Mrs. Ryerson smiled faintly at the sally, but the lawyer's face grew more serious. He despaired of making this volatile young lady realize the gravity of her position.

"I would remind you," he began, clearing his throat nervously; "I would remind you that a tugboat is a rather expensive—ah—luxury for a young woman with so limited a capital."

"Luxury?" echoed Phoebe. "Dear Mr. Stark, it's going to be a necessity. The Phoebe must keep us going."

"I have thought that over very carefully," said the lawyer, relieved to find the conversation returning to a saner plane. "I have gone into the matter with the utmost care. Perhaps had there been a son it might have been different, but since you will have to hire a captain I am afraid it will eat up all the profits and you will have to take time to manage the boat after a fashion with absolutely no return."

"I shall be my own captain," said Phoebe, with dancing eyes. "I am not afraid to work, and I'd rather be out on the water in the pilot house of the Phoebe than selling ribbon or teaching a lot of unruly children."

Mr. Stark made a gesture of despair.

No sooner did they reach a sensible conclusion than Phoebe was off on a new and even more insane tack. He half regretted that he had had anything to do with the matter, but Phoebe's voice drowned his protests.

"I have a master's certificate," she reminded. "I know the boats as well as anyone, and since you admit that the tug can make enough to captain, I guess we'll have to the captain's pay."

Stark argued for an hou Phoebe would have none of hin mother sided with her, and w last, Stark left the house, Ph carried the day, and he w his head sadly at the thoug wild venture.

There had been a time Ryerson Towing Company possessed of a fleet of ha ocean-going tugs. Then evi fallen. Ryerson's partner cided to sell out and go West of the profits of the venture M son had put into the purcha partner's share of the busine

Things had never gone same after that. Some of had been sunk, one had gon boiler explosion and two had to satisfy important creditor only the Phoebe, which John had captained himself.

The succession of misfo sent John Ryerson to his after the funeral, Stark h taken to settle the estate planned to sell the tug and a meager sum realized, but he counted upon Phoebe.

When the towing company a great enterprise, she had j applied for a master's certific one had been granted. She h aboard the boats as a girl, a she had grown too dignified tomboy, she had owned for a small power boat that had no long after the hard times came

She knew every foot of the and she found her father's only too glad to ship under h ter. Within a week after her the Phoebe was scouting a bay and river for business a good share.

After it was found that could be depended upon, s her father's old friends gave tracts and business began to

"I'll revive the Ryerson c yet," she said, exultingly, as in the little home that she w ing so bravely to keep. "One days you'll see me commodor fleet, and it will be a fleet as dad owned."

"You'll be married long bef said Mrs. Ryerson, with a s she patted the smooth brown

The brown head shook in disapproval of the statem

"Never," announced Phoebe. going to stick to the business.'

"We'll wait and see," sa mother, but the kindly fac clouded with anxiety. Somet was a little afraid for her some daughter.

For herself Phoebe knew She held the wheel and sent t be on her course as surely safely as though she were a More than once an adroit n got the boat out of a tight p the crew were wont to brag th Phoebe could lead all the oth through the toughest chan show them a safe way through

By winter the success of th was firmly assured, and Phoebe h self began to believe that the wi dreams in which she had been dulging for her mother's benefit migh come true.

She had steamed up to the coal poc

et one afternoon to refill the bunkers. Outside the bar the sea was heavy and few boats had tried to make the harbor.

Besides some lighterage work there had been little to do, and Phoebe was feeling blue. If such weather kept up for a few days longer, the Phoebe would have its first loosing week, and the crew felt as badly as she did at the prospect.

As the coal rattled down into the bunkers, a little knot approached the boat, the central figure a fussy old gentleman in very evident distress. Bill Jenkins, the Phoebe's mate, was superintending the job, and to him the fussy little man propounded the question as to whether he wanted a job.

"Ask the skipper," said Jenkins, nonchalantly, with a nod of his head toward the pilot house, where Phoebe sat looking out over the troubled waters.

"Where is he?" was the helpless answer. Bill grinned.

"You see that lady up in that little house?" he demanded. His questioner nodded an assent.

"That's him," said Jenkins, the smile growing wider. "He's a she and the best skipper on the river."

"But a dozen captains have already refused this job," expostulated his listener.

Jenkins nodded. "All the more reason for seeing her," he declared. "She'll take a job anywhere there's water."

"But this is too risky," the man said, as he started to turn away.

Bill ran after him. "There ain't nothing too risky for our little captain," he said, proudly. "Come aboard and tell us about it."

His grasp was firm on the other's arm and the old gentleman had no choice but to accompany him.

"Here's a man who thinks he's got a job too big for you," said Bill, as he thrust his captive into the pilot house.

"We are not afraid to tackle a job," she said. "What is it you want?"

"You know the lightship?" demanded the stranger. Phoebe nodded. "My wife is out there," he explained. "We live down on the point and she and my son were coming up to town on a launch. The power gave out and before he could get help they were carried out to sea on the tide and were thrown against the side of the lightship. They were taken on board, but my wife's legs are broken and there are internal injuries. One leg was ground between the ship and the launch, and the wireless operator declares that unless I can get a surgeon out, there is no hope of her living."

"Have you the surgeon?" asked Phoebe.

"He is in the office. I was told that the boats all came here to coal and this would be the best place to look for a tug. We have been here all the morning."

"Go and get him," said Phoebe, quietly. "We can make it."

For a moment the old man looked into her face, then he lifted his hat.

While he was gone to seek the physician Phoebe called for more coal and made certain that there was a supply of water in the tanks. Then she went back to the pilot house, and when the two men were on board the ropes were cast off, and there was a cheer as she skilfully swung the tug about and headed down the river toward the bay.

She knew that there was more than a little danger, but a woman was down there, lying near to death. She did not need to ask her crew if they would stick by her. Every man on board would have cheerfully undertaken a trip to Europe had she deemed it necessary.

Outside the bar the waves ran high and the Phoebe struggled through the angry sea, now on the crest of a wave, now slipping down a mountain of green water to fight a way up the opposite side of the watery valley.

About the lightship the waves seemed to gain in height, and Jenkins came into the pilot house to help her with the wheel, which was almost too much for the girl to handle alone.

Phoebe jockeyed with the tug to gain the lee of the lightship. A dozen times she slipped past too far away or upon the wrong side; but at last, watching her chance, she pointed the nose of the tug for the stern of the ship, bringing her alongside.

Then the tug backed the propeller until the hawsers were made fast, and the physician and the anxious husband were hoisted aboard.

The tug stood off until, at last, the physician came on deck again. Through the megaphone he called to the tug and there came another fight with wind and tide. A second time Phoebe won and for a moment the little tug lay beside the hulk of the lightship.

The physician dropped aboard, and as they slipped past and headed for the city again the other passenger came on deck and in pantomime expressed his gratitude.

"He told me to get your address," said the physician, "and to tell you that he would send you a check as soon as he could get to shore."

Phoebe gave a little cry. "I had forgotten all about the money," she said. "I only thought of that poor woman out there dying for want of assistance. Do you think that she will get well?"

"Now," he answered, significantly. "It was a close call. Had we been delayed much longer the operation would have been useless."

It was three days later that Phoebe, coming home, found a letter waiting for her, enclosing a check for $1000. Her eyes glistened as she caught sight of the figures.

"It was Mr. Humphries, the millionaire," she cried, as she dropped the slip of paper in her mother's lap.

"I suppose that now you will be ordering a new tug; the second of the fleet," suggested Mrs. Ryerson. Phoebe blushed.

"Not exactly that," she confessed. "You see we shall need some new things here before—before I am married."

"Married—to whom?" asked Mrs. Ryerson.

"This is my second fee," explained Phoebe. "As we were fighting our way to the lightship Bill came in to help me with the wheel and—and we worked so well together that—that I told him that he could be captain and I would be his first mate."—Farmer and Fruit Grower.

MISFIT SPECTACLES.

I've wondered why the spectacles
that help grandpa to read
Should make things when I wear
them look very queer indeed;
Good reason why his spectacles for
me would never do,
For, don't you see, my eyes are
brown while grandpapa's are blue.

The best trees for setting should have an abundance of roots, because much depends upon trees starting early and making a fair growth the first year.

The Produce Markets

Los Angeles Markets

Butter.

LOS ANGELES, April 1, 1908.

Notwithstanding immense receipts of butter during the past few days, quotations are still same as last week. During Saturday and Monday over 35 tons of butter were received in this market. The receipts will doubtless increase and storage will open for much of the product. The tone of the market is strong.

Citrus Market

LOS ANGELES, April 1,

The heavy shipments of the few weeks have finally exceede demand which continued keen weeks. Present shipments are 175 cars per day or a shrinkage cars. This will probably correct weakness. Actual shrinkage in has been about 10 cents per Quality of nearly all shipments the finest.

Lemons are yet in a bad way little prospect of early recovery.

Shipments.

Total shipments of citrus fruit date are 14,960 cars, of which 1837 lemons. Last season to same date 244 cars, of which 1285 were lemo

MAKE A ROAD DRAG.

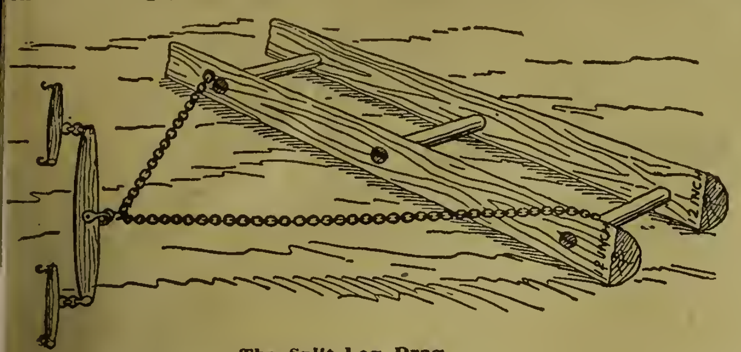
ing road drag, now most uni-
used on heavy soils, is con-
as follows: Select a log of
it wood, 12 inches thick. Cut
feet long for an ordinary team
s. Split the log in half, and
e two-inch holes through each
such a manner that the rear
en set on edge, will stand 16
to the left of the front half.
some pieces of timber of prop-
nsions, hew them down so they
the augur holes, drive them in
y and wedge the ends.

halves of the log must be set
e with the flat sides in front.
piece of old wagon tire, or,
still. a three-inch piece of sheet
hat measures four feet in
shoe the front right hand side
log. Take a log chain, insert
d through the augur hole bored
he right hand end of the log
sten with a pin through the link. The other end should go around the connecting timber at the left hand end of the front log and over its top and fasten with a pin through the link, as shown in the cut.

With a few boards sawed the proper length and cleated together, a platform is made on which the driver stands. Remember to have the two halves of the log which make the runners 30 inches apart when the drag is finished.

Walk the team slowly, change position on the platform to ensure even distribution of dirt, and use when the ground is moist.

In this connection it may be well to call attention to a late road maker known as the White City ditcher, which costs $125, and is a thoroughly good machine, easily handled. When several neighbors unite in its purchase it does not cost very much. Follow this machine with a road drag and you have a fine dirt road which will last.



The Split-Log Drag.

A LEADING PART.

"My brother has a leading part in that new drama."

"What part?"

"He leads a horse across the stage in the last act."—Philadelphia Inquirer.

D. F. Conant of Modesto says: "I find the Cultivator has gotten into a good many homes around here, but it is no wonder for once seen is to want it reguarly."

THE UNIVERSITY AT LARGE

Continued from first Page.

ter idea of the character of agriculture as the greatest of the applied sciences.

The University Farm.

I cannot, however, forbear reference to two of the greatest contributions to the advancement of the Agricultural Department and brief comment upon their significance. A very clear indication of the attitude of the California public mind toward agricultural education is seen in the provision of $150,000 made by the legislature of 1905 for the purchase and equipment of the University Farm at Davis, in Yolo county. It is the most important single contribution which the State has ever made to the development of agricultural education. It will supplement all that has been accomplished on the scientific side by furnishing splendid opportunities for instruction in farm policy and practice which have not been adequately provided for hitherto. In the future the University students in the agricultural course will be brought face to face with the practical problems of production, and instruction therein will be given concreteness and directness. There will also be the fullest attention paid to the short courses in the various branches of farming which will enable both old and young to devote themselves for a few weeks or months to studies of the best and most profitable ways to handle plants and animals and to satisfy themselves that these advanced ways are best because they embody the latest science involved in each operation, and because the quality and market value of the product demonstrate its economic superiority. The instruction on the farm will neither duplicate the instruction or the equipment at Berkeley. At the present time the University Farm is a scene of notable constructional activity. Water supply and distribution, sewage disposal, dairy barns, seed houses, mechanical shops, etc., provided for the legislature of 1907, are all going forward at a rapid rate to supplement buildings previously constructed. A commodious dormitory and farm commons are planned for building during the coming summer. Orchard and vineyard planting for instructional purposes has been made. Equipment in live stock, machinery, apparatus is proceeding and it is planned to begin regular courses of instruction and short, special courses during the coming autumn.

The Kearney Bequest.

Another great adjunct to the University work for agriculture will be realized in this vicinity through the munificence of the late M. Theodore Kearney, providing an endowment which may have a value of something like a million dollars, for the establishment and maintenance of agricultural instruction and research in the San Joaquin valley. California by a third of a century of fitting generosity toward agriculture, culminating in the provision of the University Farm, has demonstrated the possession of a public sentiment which leads patriotic citizens to assist the State toward the more speedy attainment of that which is recognized as the most potent agency for the promotion of prosperity and success among our citizens during the coming generations. It is too soon to undertake any outline of what should be done with this new endowment when it becomes available. That will require careful consideration in connection with the informal wishes of the donor. It is sufficient at the moment to say that ample opportunity exists for its wise and effective use for the promotion of the industry to which the donor enthusiastically gave his most diligent efforts and succeeded so well. There is no present danger of too much money being available for research and instruction in agriculture in such a State as California, where the population may be multiplied ten or twenty fold without approaching density and whose capacity and variety of production is hardly yet descried. The great San Joaquin valley, where Kearney was a pioneer in undertakings which have commanded the attention of the world and in the development of products which have reversed the old courses of the world's commerce, has hardly entered upon the greatness of her future. In that future there will be the fullest scope for the wisest employment of the best agencies for agricultural education and research which his devoted gift can create and maintain.

Imperative Need at Berkeley.

But while the agricultural department is doing its best to fulfill its mission at large in the State, the total inadequacy of its housing and equipment at Berkeley must be urged upon a generous public. Every success which is scored in its work at large, places new burdens upon its work at home. The Department has taken possession of, and used as well as possible, every sort of temporary shelter which could be found, and still there is not space for its investigators, teachers and pupils. The chief agricultural building of the University cost less than ten thousand dollars and was built twelve years ago. It would hardly be considered a respectable grammar school building in a small city—Berkeley is building grammar schools which cost four times as much. In other States University buildings for agriculture are equal in dignity to those for other lines of learning, if not superior thereto. California will surely not long allow the present outfit at Berkeley to remain a reproach to her leading industry. This is a matter which the coming session of the legislature should diligently consider.

CARE OF CHICKS.

I allow the chicks to remain 36 hours in the incubator, then feed a very small portion of dry rolled bread (just what they will consume.) They are then placed in an indoor brooder, where they are comfortable and happy. I never give water until they have finished the first feed (dry rolled bread) in the brooder. I then fill a cup with water, with the chill taken off, place a saucer over the top and invert the two. This makes a very nice drinking fountain for small chicks. Place the saucer on a plate so the dampness will not get to the floor of the brooder.

I make a mixture of parched bread, cracked rice, rolled oatmeal and charcoal, fed in small quantities for a few days, and cover the floor of the brooder with clover hay, finely cut, and sand. After the chicks are ten days old I give every other day a small portion of liver or beef, cut fine, and keep charcoal where they can get it at all times. For green food I give lettuce leaves. I always feed regularly and have had splendid success with my chicks.—Commercial Poultry.

ashington Navel Grove with a Record

The Kind of Orchard Which is Too Seldom Seen. The Five and and Ten-Acre Owner Does Not, as a Rule, Secure the Profit Which the Large Landholder or Estate Does. Let the Small Owner Use the Same Intelligence as the Foreman of the Large Orchard

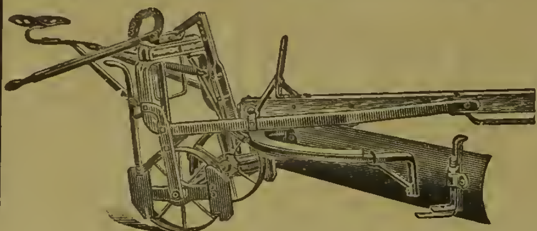
Courtesy San Dimas Nurseries, San Dimas, Cal.

IS grove comprises 10 acres, was planted in 1890, in a rich, :composed granite soil to second-size trees, and by reason of ɔod care has proven a pronounced success. In 1892, the crop ɔr $80.00; in 1893 for $635.00; in 1894 for $2780.00; in 1895 for 00; in 1896 for $4000.00; in 1897 for $5300.00; in 1898 for 00 (this was the season of heavy wind storms when the trees ıuch of their fruit); in 1899 for $5830.00; in 1900 for $6000.00;)1 for $6250.00; in 1902 for $6100.00; in the years following data is not available, but in the rough the returns averaged $6000.00 to $7000.00 annually.

:ry grove in California will not do that well. Soil, local cli- conditions, water and more than all, the personality of the owner enter into such a production. The latter factor is one which calls for serious consideration. As Mr. Reed said at Whittier, the question is serious. The ordinary orange grower does not intelligently consider all the questions before him and through his ignorance, or at least carelessness, in allowing the mistakes to lower the general tone of the orange market and, in turn, his own condition is made worse until the larger holder of orange groves, with his keen management, is year by year enlarging his holdings, while the small owner is becoming more discouraged.

When the owner of the smaller acreage awakes to his full privileges the orange industry will be more profitable and there will be more orchards like the above, which are now the exception.

Make Roads Easier with One-Man Grader



Those big costly road machines have stopped thousands from making the roads better in their sections. But now they can get a light, easy-to-pull grader and do the work quickly, cheaply, easily. One man and a team can do almost every job with no fuss or trouble. Machine weighs only 600 pounds. It is the

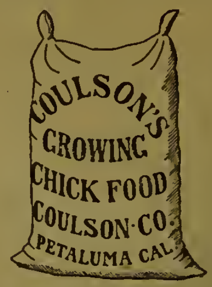
Coulson's
Growing Chick Foo



After hatching your chickens and raising them successfully u 5 or 6 weeks old, they are worth something to you, and every that dies now is a distinct loss in the cost of feed you have use well as the cost of hatching and subsequent care of them.

Therefore, in deciding what feed to use now that they are get too large for the baby chick food, you must exercise the same as before, to give them the best.

The Best Feed with the Least Labor

Is what you want and that is where

Coulson's Growing Chick Food

comes in.

Coulson's Growing Chick Food is rich in protein, owing meat and bone it contains. The grains and seeds in this food all ground up, a portion being granulated, so as to give their d organs sufficient work to insure health. The food contains a variety of ingredients, which furnish the growing chick all quires for quick, healthy development.

COULSON'S GROWING CHICK FOOD is especially adapted feeding dry in hoppers, as well as dampening as a mash.

THE HOPPER STYLE OF FEEDING HAS NUMEROUS VANTAGES:

COULSON'S GROWING CHICK FOOD can be placed in a ho in sufficient quantity to last for several days. If this hopper is p erly constructed there will be no waste, and the consequent savi labor in feeding is large. The chickens thrive amazingly well and are kept in the most healthy condition, as with the dry f ways with them, they have no desire to gorge, with conseque tion troubles.

Many have hesitated about trying this method of feeding b son of the cost of the hoppers required. A good hopper for dry ing can be made by any one at a very slight expense. We w pleased to furnish a simple method of making these hoppers. of charge to you.

Try the Dry Feed Method

with

Coulson's Growing Chick Food

and we are sure you will never use any other.

COULSON'S GROWING CHICK FOOD can be used for chicks 4 to 6 weeks old up to 3 months old, when COULSON'S EGG FOO IMPROVED MASH EGG FOOD should be fed them.

If your dealer does not handle COULSON'S GROWING CH FOOD, write to us and we will tell you where you can get it.

ssibilities of Walnut Blight Control

By the Use of Immune Varieties

By H. J. RAMSEY, of the Southern California Pathalogical Laboratory, Whittier

particular phase of the walnut problem,
rning which I shall try to deal more es-
lly, has already been discussed to some
this convention.
estion of walnut blight control has been
problem with nearly every grower of
or the last half score of years or more.
light has entered and does today enter
ly every consideration or phase of the
dustry. In figuring on probable returns,
ıt growing as an investment or as a
livelihood, the great big question mark
vays stands out in the foreground is that
ight. It is always a factor and perhaps
est factor in reducing the profits to be
rom a walnut orchard, and is today the
drawback to walnut growing.

)ecreases.

e of a great increase in acreage, the out-
ead of increasing, is now actually less
as three or four years ago; this decrease
e mainly to blight. However, blight alone
by any means account for all the losses
d in the past.
esent bearing acreage of walnuts in the
day is composed entirely, with but a
exceptions, of seedling trees. These
ptions, which happily there are, are the
ch have proven very conclusively the su-
of the grafted trees as compared with
ling. They also go far to prove that if
of the seedling orchard is not at an end,
as far as future plantings are concerned,
l be. In a great many instances the
hich are popularly attributed to blight
ave been materially lessened by more in-
fertilization, cultivation and irrigation.
seedling walnuts have in many cases ex-
almost all of the soil's available fer-
l are going back; due both to lack of soil
nd because of old age. The English wal-
does not seem to be able in all cases
t itself readily to changing climatic and
ditions. It is too subject to frequent
of temperature and the variable mois-
tent of the soil. While it may do well for
er of years, there come times when, be-
f peculiar climatic and soil conditions,
ling tree fails to come up to the require-

lesirability of using grafted trees up to
ent time has been recognized by but few
growers, though now they are commencing
ze more and more the advantages of the
tree as compared to the seedling. In light
past experience with all fruit trees and
e walnuts themselves, it would seem al-
eless to urge the planting of the grafted
preference to the seedling. The time
ne when a person will no more think of
out a seedling walnut orchard than he
of planting a seedling apple or orange
. The grafted trees insure one an or-
f walnuts all of one variety and not of as
arieties as there are trees in the orchard.
ıt varieties, all of them good, when mixed,
t command the price that each variety
f sold separately. Again, the grafted or-
vill bear more uniformily, both as to quantity and quality, and will also come into bearing earlier than the seedling.

Watch the Good Tree.

If one has growing in his orchard a particular tree bearing a variety of walnuts superior to all the others in his orchard, he will perpetuate that variety by grafting or budding from that particular tree. It will thus be possible for him to grow an orchard with every tree in it equal to the original tree from which he propagated. On the other hand, were he to plant the walnuts from this tree, he would find, as all have found, that instead of having an orchard of uniformly sized trees bearing a uniform quantity and quality of nuts of the same variety, he would have an orchard of the usual seedling type with each tree a different variety differing materially in season, size, quality and quantity of walnuts produced. It is largely a matter of chance as to what kind of an orchard one obtains when planting seedlings and whether or not one will obtain even a single tree equal to the parent tree.

Choice of Stock.

The grafted trees, too, allow one a choice of roots as best suited to particular soils or conditions. There is no particular reason, if one would but select intelligently and carefully his variety, why one should not have a producing orchard bearing at least one hundred pounds of walnuts to the tree instead of having but two or three such trees in the whole orchard.

It would seem then that from every standpoint the grafted tree is by far preferable, leaving out even the possibility of blight control by means of immune varieties. It has often been said that there is nothing so bad but what there is a little good mixed in with it. While walnut blight has been the cause of enormous losses to the walnut growers, it has hastened the time when the grafted walnuts will displace the seedlings. By hastening this period of transition from the unscientific seedling epoch of the past to the more stable scientific era of the future, it has been the means of putting the walnut industry on the plane with the other great horticultural industries of our State. With sorrow in their hearts, many regret the passing of the good old days when the seedling walnut was in its prime, but they will hail with great joy the new era when they more fully realize the advantage of the change and the opportunities it offers.

No Control.

Ever since the blight has become such a serious menace to the business there has been an urgent demand that a remedy be found. While the cause of the blight has been quite fully worked out, no satisfactory method of control, at least by the use of chemicals, has yet been found. The great and popular demand has been for some simple and effective means of blight control, either by the application of some chemical to the soil, or of some spray on the trees, or even by the injection of some antiseptic into the sap of the tree itself. With the idea of finding some way of controlling the blight by means of a spray of some sort, the life history of the germ causing the blight has been fully worked out with the hope of finding some stage in its life history when it could be most easily reached by some spray material. A number of different sprays have been tried out very thoroughly and carefully at different times during the season, but none were found to be effective in controlling the blight. Though the twigs were absolutely covered with the spray, the typical blight lesions would appear on the branches the same they did on the unsprayed ones. As far as the amount of blight was concerened the trees were sprayed or not and at whether the trees were sprayed or not and at the time of the year when the spray was applied. Owing to the great size of the trees the consequent cost of application and the difficulty in getting the tree thoroughly covered with the spray, the saving of walnuts would have to be considerable to make it a paying operation.

A Fake.

The idea of inoculating the tree with some antiseptic by boring holes into the trunk of the tree and injecting into the tree certain chemicals has been exploited, chiefly for private gain, by certain unscrupulous persons, both in walnut blight and pear blight. Even if it were possible in this way to make a tree immune to blight, the experience of those who have tried it does not extend much hope in this direction. It is hard for the popular mind to conceive of the fact that chemicals thus injected into the trunk of the tree would not exercise the same influence on the tree similar to what it would in the human system. Injected into the trunk the materials, whatever they may be, will be taken upward with the sap, carried to the leaves, where the elements that can be used by the plant as food are transformed into an organic form, while the others are left as waste products and may be very injurious to the plants. All the experimenting which has been done in the scientific way as regards the control of any fungous or bacterial disease by this means does not record a single instance where it has been a success.

Possibly a Little Hope Here.

As regards the application of chemicals to the soil in the hope of making the tree more or less immune, something has been gained in an indirect way. The possibility of making the tree immune or resistant by soil application needs careful and very extended observation and experimentation. However, we do know that judicious fertilization will greatly increase the productiveness of a walnut orchard to such a degree that in spite of the blight one can obtain remunerative returns.

There is no question but what the heavy application of stable manure, supplemented by some fertilizer, strong in nitrogen especially, followed by some leguminous cover crop in the orchard during the winter, will make any walnut orchard a better investment. In connection with this, a late fall and winter irrigation will help to hold the trees back in the spring and make them less susceptible both to blight and frost injury. This treatment will tend to make the trees heavier bearers, due to increased vigor and to the fact that they will escape in a large measure the worst period of blight infection early in the spring.

Continued on Page 423.

The Best and the Cheapest

When Arsenate of Lead came into use three years ago it was widely advertised as a spray that would kill the worms and never burn the foliage. This statement was true in many interior valleys but in our foggy coast sections there has been serious injury by burning.

We guarantee our BEAN SPRAY ARSENATE OF LEAD to contain not less than 12 per cent Arsenic Oxide so it is SURE TO KILL; and not over 50 per cent of water (instead of the customary 52 per cent to 55 per cent) which gives THE MOST FOR YOUR MONEY, and at the same time is an "ortho" or NEUTRAL LEAD and CANNOT BURN even the most delicate foliage.

Our California Agricultural Station does not furnish analysis for publication, but we are pleased to submit the following to verify our statements:

OREGON STATE EXPERIMENT STATION.
C. E. Bradley,
Assistant Chemist
Corvallis, Oregon, 3-21-08.
The Bean Spray Pump Co.,
San Jose, California.
Gentlemen:

I herewith submit analysis of the sample of your lead arsenate which Professor Cordley received from you some days since:

Moisture	42.17	per cent
Total lead oxide (PbO)	42.04	"
Total arsenic oxide (As205)	12.83	"
Soluble arsenic oxide	0:17	"
Soluble impurities	.96	"
Insoluble impurities	2.00	"
	100.17	

Your guarantee of not less than 12.00 per cent arsenic oxide and not over 50 per cent water is thus substanti ated by our analysis.

Our results also show this to be a neutral or ortho arsenate.

Very truly yours,
C. E. Bradley.

Notwithstanding the fact that we have a better and a stronger Arsenate of Lead than ever before the PRICE IS LOWER.

Write for quotations or send in your order if in a hurry. You will get the same price either way—and prompt shipment.

Everything For Spraying

Deciduous Fruit Cult

ORCHARDS ON HARDPAN.

THERE is a great incentive to plant deciduous orchards on almost any kind of soil that may be available. The prices of fruit the last few years from orchards that are even moderate bearers, have made men moderately rich. There is one class of land that should never be planted to fruit trees of any kind. We refer to hardpan that comes within about two feet of the surface. Trees will make a fair growth the first two or three years, but after that they have a hard time ahead of them. As soon as the roots get down where the water is held by the hardpan the trees will begin to deteriorate. It is a common idea that Bartlett pears do well on wet land, and to a certain extent this is so, but when hardpan is within three feet of the surface, we have seen it tried to a finish. Peach trees that grew to good bearing size died before they had paid for themselves. Late spring rains cause an excess of water in the soil at an unfavorable time and fermentation of the sap is a result. On adjoining land where there were six feet of good soil, the trees continued to grow and produce good crops.

There is a large area of this class of soils in California, and if handled properly will produce paying annual crops. Such soil requires very little water at any one time and if proper surface drainage is provided, large crops of wheat and Egyptian corn can be raised on it. With proper drainage, alfalfa will produce well with proper summer irrigation. Such land should be benefited by the application of acid phosphates, as most of the prosphates are locked up in combination with the lower oxide of iron. This is shown in the small globular, hard and reddish or black particles found in such soil. The phosphates in the fertilizer would supply for the present need of the grain and especially wheat, while the excess acid will dissolve a portion of the phosphates that is combined with the bases.

$20,000 REWARD.

Not as a matter of news, for it is far too old for that, we reprint the following conditions which the walnut associations made some years ago when they offered the $20,000 reward which caused much comment. The Cultivator still receives inquiries regarding this reward. So we asked Mr. J. A. Montgomery, secretary of the organization, as to conditions.

Note that the 13th condition says that if the remedy is not forthcoming the reward may be withdrawn in 1907. But while it is probably that the remedy will never be discovered, we doubt not liberal treatment will be granted to the lucky discoverer who performs the miracle.

The conditions governing this offer are as follows:

1st. Experiments may begin at any time.

2nd. Experimenters to be responsible for damages to trees and crops.

3rd. The method of treatment must be practicable and within reason as to expense.

4th. All applicants for the reward shall file a description and formula with the secretary of the executive committee at the time of beginning experiments and such papers shall
remain a secret and shall
tection against subseque
menters who might make
invention.

5th. No reward shall be

es may be grafted from the he buds begin to swell till well om. It is better to cut off the top and graft the whole tree at ime. Grafting part of a tree ear and another part another makes a tree that will always be aped. The lower branches that out at the bases of the main should be left. They serve to up the excess flow of sap while cions are getting a start, and also serve as a protection st mechanical injuries and acci- that are always liable to hap- The branches may be cut back degrees as the tops develop, h it forces a better top growth emove them as soon as the s make a good start. In this the trunks and branches ld be whitewashed to prevent urn.

anches two inches and over that to be grafted should have from to four scions inserted equidis- In the case of the smaller the number of scions should educed to one after the first sum- growth and on the larger ches enough scions should be al- d to remain to form a good top.

The object in allowing all the scions to grow one year and then cutting them out is twofold. There is a better chance of a good start and when all are allowed to grow, a cut is soon formed from new wood over the stump. The removal of the surplus branches makes smaller wounds which heal over quickly. We have grafted and pruned large trees in this way which showed no scars at all after the second year, only a change in the appearance of the bark being noticeable.

Any method of grafting is successful when it is quickly and neatly done and the inside barks are made to match. Splitting the stump of large branches is not desirable, as it leaves cavities in the hearts of them. When the bark slips easily, the scions may be inserted under the bark in a ring around the top of the stump. This method works well on peaches. On large branches the saw graft is desirable as it leaves the stump solid and thereby gives less chance for decay. A cut is made across the corner of the stump so that it will run down on the side a couple of inches. This is trimmed out with a straight cut of the knife, forming a slot widest at the top. A scion is trimmed to fit this and is pushed down into it from above till it is snug. As soon as one stump or branch is completed it should be waxed at once. This is best done by having either liquid wax or ordinary wax kept warm enough to spread with a brush. Brush over all cut places and while still sticky spread strips of cloth over the waxed portion and wax again. This prevents the wax from cracking. All saw cuts should be waxed.

Apricot and almond trees should not be grafted in the old wood. They should be topped and the young sprouts budded as soon as they mature enough to give firm wood. The wood of these trees is so hard that a good union does not form. Apricots may be topped in July after the crop is off and the sprouts that come may be budded in September. These buds may be left dormant till the following spring when the sprouts may be cut back to the buds and the new variety will have a fine top by the end of the season.

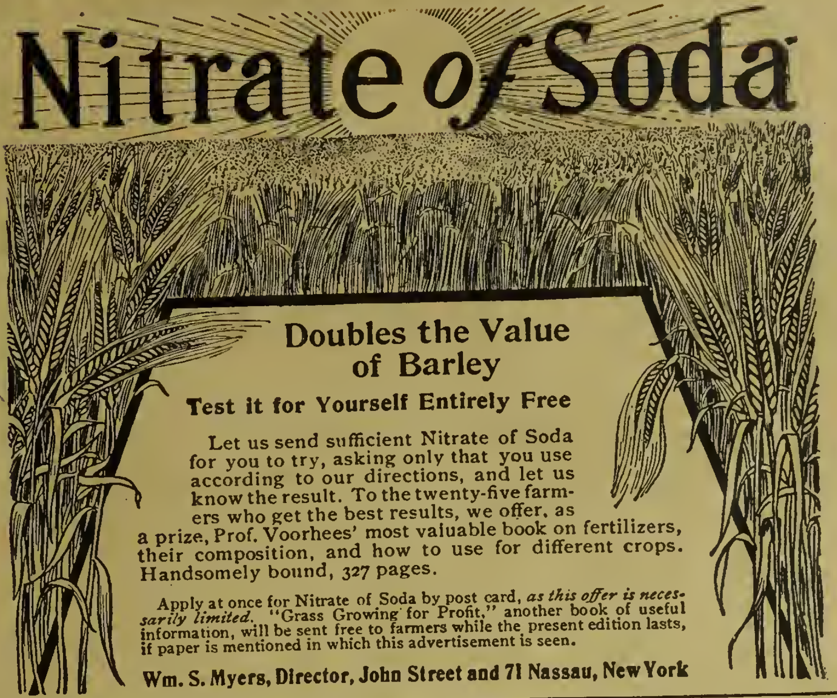
A good receipt for wax is four pounds rosin, two pounds beeswax and one pound of mutton tallow. Heat till it is thoroughly liquid and stir to mix well. By pouring it in a tub or pan of warm water and pulling it like candy after oiling the hands, it will become tough and improves in quality.

SOUR SAP OF THE APRICOT.

"Sour sap" is an altogether different disease from gumming. The latter is easily cured by simply splitting the bark with a knife. The same operation in the case of sour sap may serve to spread the disease.

When sour sap makes its appearance on a tree, it is already beyond help. The disease is as quick in its work as pear blight, and is as disastrous to the trees affected. It, however, is not so rapid in its spread, but when a tree is once affected, it will never recover. Sometimes a single tree in an orchard will wilt and die in a day and the balance of the trees will never show a sign of the trouble. Again, we have seen several trees in a body completely killed.

The disease is called sour sap because of the fact that we have no definite knowledge of what it is and from the fact that the sap seems to ferment and has a sour smell. From our present knowledge of the disease, there seems to be no method of preventing its occurrence. It is not common every year, but some seasons is quite common.



Doubles the Value of Barley

Test it for Yourself Entirely Free

Let us send sufficient Nitrate of Soda for you to try, asking only that you use according to our directions, and let us know the result. To the twenty-five farmers who get the best results, we offer, as a prize, Prof. Voorhees' most valuable book on fertilizers, their composition, and how to use for different crops. Handsomely bound, 327 pages.

Apply at once for Nitrate of Soda by post card, *as this offer is necessarily limited.* "Grass Growing for Profit," another book of useful information, will be sent free to farmers while the present edition lasts, if paper is mentioned in which this advertisement is seen.

Wm. S. Myers, Director, John Street and 71 Nassau, New York

Placer Nurseries

We have now growing for next season's delivery a large stock of all leading varieties of trees and vines. We propagate only the best commercial sorts. Our trees and vines are the best that good care can produce and in their selection, propagation and growing we spare no labor or expense; and they are true to name. That is what you want.

Contract now the trees and vines you will want for next season's planting.

Write us.

THE WHITE FLY SCARE OVER.

HORTICULTURAL Commissioners in the different counties of the Sacramento Valley have been making a thorough search for the White fly, fearing that it might have spread from Marysville and Oroville, but reports from all sources indicate that it is as yet confined to those two points and that it is pretty well under control there. Of course, there is still danger of infection from one or the other of these points, but the pest here is so thoroughly under control that this danger has been reduced to a minimum and, with proper care, hereafter there will be little danger to be apprehended of this pest reaching the orange sections of the south.

RED SPIDER.

In a report issued some months since by B. J. Jones, field man of the San Dimas Lemon Association, he gives information regarding the red spider. As it is approaching time when that pest will again be in our midst, we quote:

Red spider was abundant throughout April and well into May and was very difficult generally to control on account of the long continued cool weather which prevented the sulphur from being effective. There was generally sufficient dew at some time during this period to stick the sulphur, though some practiced throwing water over the trees with a small spray pump previous to the application and found this very effective. From one-fourth to three-fourths pound of the dry sulphur per tree (preferably flowers of sulphur) is sufficient and should be sprinkled on in a fine mist free from lumps which are likely to burn the foliage in hot weather. A hand dust sprayer such as is used for sulphuring vines is very good for this work; it gives a finer and more even distribution of the material and will save the eyes of the operator to a large extent. A sulphur spray has been recommended which contains some sulphide of potash. This neutralizes the sulphuric acid and prevents burning. But this is no more effective in cool weather than the dry sulphur and few have spray outfits with which to apply it. The red spider is parasited by two or three species of ladybirds, the common lace wing fly, several species of spiders and one or two of coniopteryx. The last is most effective and does much good in devouring the eggs. While all these parasites are present here they are not effective on with the enormous multiplication of account of their inability to keep up the host.

ACTION OF COVER CROPS.

The Division of Soils of the Department of Agriculture has been making investigations for several years along the line of plant excreta. There is a belief that all soils contain enough plant food for many crops, and that when the soil is infertile, the probable reason is not the lack of plant food or of soluble plant food, but the presence in the soil of certain bodies, partly known, and probably others unknown, which are poisonous to the growing crop. It is also believed that the source of these poisonous bodies is the previous crop or crops, says a writer in the Country Gentleman, in discussing the question of effect of cover crops.

Plants absorb from the soil water, and with the water, dissolved in it, mineral matter. They are said to excrete matter no longer needed by the plants. A German scientist, after a long series of very expensive experiements, believes that plants excrete potash, as the ripe crop contains a great deal less of it than the same crop when sending forth vigorous shoots in the early part of its growth. The American experiments go to show that plants poison the soil by emitting something obnoxious to subsequent crops. Weeds injure crops, on this theory, not alone by taking water and plant food which ought to go to the crops, but also by manufacturing and sending out into the soil poisonous substances. Crop rotation is necessary because certain crops poison the soil for certain other crops, while their excreta are less poisonous to others.

It was shown in these same series
of experiments that these po
were destroyed, or at least thei
fects were obliterated, by m
certain green substances with th
fected soil. Leaves were effecti

matter in the manure.

Controlling the Army Worm

Horticultural Commissioner S. A. Pease of San Bernardino county has made an extensive study of the army worm, and has bred out many of the pests, also its natural enemies. Mr. Pease is one of those natural observers who "see" things, and we are glad to have him tell in this short article some method of control.

The season has arrived to again discuss cutworms or army worms, and I will answer a few questions that have been asked.

The cutworm is hatched from eggs laid by moths. These moths in Southern California are Agrotis saucia and Peridroma saucia; there may be others but of these two I am sure. The moths are of quite dark colored and about one and one-half inches across and may be seen in the twilight fliting over the flowers and shrubbery. Usually the moths lay their eggs in the month of March and the cutworms appear in April.

They are quite easily controlled in the orchard, but it is a much harder matter to do anything with them in the alfalfa fields as it is not possible to keep them off the alfalfa, and if you spray the grass it would not be fit to feed to stock. Banding the trees with fly paper of tree tanglefoot will save the oranges. Probably the best way to fight the pests in the hay fields would be to put out bran-arsenic bait, which is made as follows: Mix 40 pounds of bran and 20 pounds of middlings and 20 pounds of white arsenic together thoroughly and then add two gallons of cheap molasses and sufficient water to make the whole into a crumbling moist mash. This may be placed along where the cutworms get it.

Cutworms are often controlled by large, black beetles, Calosomas' and are also many of them parasitized by parasitic flies; I have known as many as 70 per cent of them to be killed in this manner.—S. A. Pease.

er for five head of horses.

hen water is taken for irrigation,
hould be remembered that the
unt required for a good many
l of cattle would not furnish
h water for irrigation, and that
n a steady draft is made on the
l the water is lowered by a noticeable amount; and unless the water is furnished as fast as it is withdrawn, the volume of water stored in the soil will be materially reduced and the capacity of the well diminished. No well has an inexhaustible supply. It should not be forgotten that the water must come from somewhere, and that it is either the rainfall or the inflow from ditches around. Where the water stands in the soil it is practically a small lake, and hence, as the water is reduced in level, the supply may be permanently lowered, and it will be unless the inflow is equal to the discharge and there is time between the periods of pumping for the level to recover.

Fortunately there are many places in the river bottoms where the gravel and sand is coarse and where the water can flow with relative ease. Under these conditions the wells may furnish one-fourth of a gallon of water per minute for each foot that the water is lowered, and for each square foot of area of the whole surface. The rapidity of the inflow would increase as the water is lowered, within certain limits, so that for every ten feet of lowering of the water table, every square foot will be apt to furnish in the neighborhood of three gallons in a minute. The lowering of the water may be expected and especially under severe pumping. If it recovers rapidly after the pumping has stopped, then there need be no particular anxiety felt about the supply up to that extent.

The effect on the permanent supply may be examined by sinking some small wells or holes, which will go down to the water surface and determine whether this pumping has any effect on the permanent supply, and how much. Before one makes a large investment it would be well to make some tests and determine what this effect is. In many places pumping plants of moderate capacity can be used with a great degree of profit, while pumps of larger capacity may be failures and prove very disappointing. Moderate lifts are thus to be considered when it is to be remembered that every additional foot of lift means an additional cost in the way of fuel.

If the cost of the plant is properly estimated, the supply to be expected is also known, and the expense of maintenance and production has not been underestimated, then a pumping plant undertaken with these conditions understood should prove very satisfactory in hundreds of places.

There have been a few cases where pumping has been for the purpose of obtaining water surreptitiously by obtaining water from a neighboring ditch or stream. Cases of this kind have not been numerous enough to have made a body of legal decisions, but in general it may be said that if the withdrawal of water by this means damages the possessions of others it can be prevented.—L. G. Carpenter, Professor of Civil and Irrigation Engineering, Colorado Agricultural College.

PROPAGATION AND CHOICE OF STOCKS FOR BUDDING.

The orange cannot be trusted to come true from seed, and for fruiting purposes seedlings may be regarded as unprofitable to plant. Growth from the seed is now, however, the method almost exclusively followed for the production of stock for budding, to the exclusion of growth from cuttings or from layers, and it is by far the best.

In growing orange seedlings, good plump seed should be selected and it should never be allowed to dry. Unless it is sown at once, it should be mixed with moist sand for storing.

The best time for sowing is a the soil has become warmed in the spring.

The choice of seedling stocks for budding is a matter of primary i portance. A deep root system a broadly extending laterals, not too near the surface, are essentials to the ideal stock.

It has been said by so eminent an authority as Wickson (California Fruits, Chapter XXX, P. 356) that "the orange root is the best foundation for an orange tree, and the seed of the seedling sweet orange is the main reliance." The sweet orange, however, would appear to be a surface-growing stock which has few deeply penetrating roots. In the University of California Experiment Station trials, the sour orange stock has been found to be decidedly hardier, and in every way better than the sweet orange stock. Among its other good qualities, it is resistant to alkali.

But the pomelo is deservedly becoming the favorite stock in Southern California. Its laterals are found at a greater depth than the laterals of the sweet orange; it produces more fibrous roots than does either of the other stocks, and the tree is consequently a ravenous feeder. It has succeeded better at the Experiment Station of the University of California than has the sour stock, which seems to lack uniformity of root growth, sometimes having but few laterals, in which case the crops are small.

Pomelo seedlings are said also to have made the best growth in the nursery.

Seedlings are grown either in boxes or in the open ground; in either case a rich sandy loam, which will not bake, should be secured.

The seedlings appear in about six weeks, and with good care in weeding and in keeping sufficiently—but not excessively—moist, they will make a growth of about a foot in the first season.

Planting out in the nursery should be done so soon as the ground is thoroughly warmed in the spring, when the seedlings will be about a year old.

The distance between the rows in the nursery should be at least four feet, to allow of horse cultivation. A distance of 18 inches between the plants in the rows will permit of the roots being sacked, or otherwise protected, when the plants are to be removed to the plantation.

In taking the seedlings from the seed bed a few should be lifted at a time, and it is essential that their roots be kept shaded and moist until the ground closes on them in the nursery row.

It is important to have an even stand in the nursery, and weak plants should be rejected. The seedling trees are very susceptible of by frost, and it is wise to giv some sort of protection duri winter.

The young plants are usuall ded after being one or two y the nursery, or at two to thre from the sowing of the seed. convenient time in the wint lower shoots and thorns are re so as to leave a clear stem of six inches for the convenience budder.

The best season at which to about the time when the seed starting into vigorous growth spring. In general, it may b however, that budding on goo rus stock may be done at an of the year when the bark o stock separates easily from the This always indicates a stron of sap. The buds must be take a vigorous, healthy tree of th riety desired. Good well-m buds should only be used; from both the base and the shoots are frequently defective

Spring buds start into grow most immediately, and have benefit of the whole summer for developing and maturing w

After the bud has made a start, the top of the stock s removed at a short distan it, and suckers on the should be continually look removed. The tender shoo bud is protected by tying stub, and when the growth bud has become sufficiently to allow of its supporting its old stock is smoothly sawed and the wound covered with gr wax or paint.

Proabably, however, a better tice is to supply supporting at once, and to cut the stocks in lopping, as, when this is the buds are said to make rapid growth.

Budded trees are given one years' growth in the nursery or two years' growth on the which, added to the year in the bed, makes them three to four of age from the sowing of the before they are ready for pl out in the orchard.

To cut a bud properly is not gether a simple operation; in the whole process of budding which requires skill and pra experience, and it would be possible to give here intelligibl adequate directions for perform with assurance of success.

The above is from "The Culti of Citrus Fruits," which may for the asking by writing R. A comb, 50 Clay St., San Fr It has some good points for the able suggestions on fertilizatio ner in citrus work and some

GASOLINE ENGINES.

The gasoline engine has com looked upon as the most and useful machine on the far cause it may be used for so different purposes. There is farm equipment of course whic its special mission would be gr missed by the farmer, but the line engine can be used for a overp part of the hard work or farm if one does a little sche The other machinery is stored after its particular season is until the next year, but the e prising farmer generally manag keep the gasoline engine busy whole year round. It looks as th the time is coming when farmers plow with gasoline engines, and grain to market with them

ees and Their Care

VALUE OF OLD COMBS.

value and care of empty nbs is a subject which has n discussed, but, judging oservations in the yards of eepeekers, there is more need- be said, writes Mrs. Millie r in an exchange. About a o we visited at the home of German beekeeper, where bees' en kept constantly for a mat- orty years and over, and were ed to see any amount of old lying about in the grass in all of decay. As every one at all ted with the subject knows, od combs cannot be rendered x by ordinary methods, since x they contain is encased in t off skins of the larvae which been reared therein, which them tough and difficult to out.

Building.

e people had no wax extractor erefore, considered the combs thless, not knowing that they far greater value in the apiary ey ever had for wax. In fact, comb, if straight and unbroken, h more in the hive than when ist because it is tougher. No on account of age alone is ever ed in our apiary, for these we r our most valuable acces- to profitable beekeeping. An- nistaken idea is that bees do e old combs—that they will d when hived upon them. Ex- ce proves quite to the con- as any up to date beekeeper stify. Comb building is a nat- istinct, especially with swarms hived, and for that reason it ot be always best to hive on all of which are filled with without supplying supers in the tendency may be exercised, reason that one may not ob- om the bees all that they are e of. But as for the bees ab- ng on account of them, when d in good shape, it is, to say ast, not reasonable. A little in- ation will usually show the although newly hived colonies ometimes leave without any ap- reason.

ne instance I remember where w colonies had been hived on mbs and had absconded suc- ly, the trouble was evidently lack of ventilation. The hives the regular eight frame Langs- with a small entrance way in nd. One after another the is settled on a small bush in of a huge boulder and were there. The covers were put on ai and the hive left for the Every swarm so hived came gain and left without further . The cause was attributed to d combs, when, in fact, it was count of excessive heat and de- ventilation.

t old combs will save building s evident to all, but their value t be estimated on this basis without considering what it costs to build the new. A comb is worth for wax perhaps 25 cents a pound. But is the ercial value of wax any index cost? In a way it may be, since be made into foundation and rted into comb again, but ation costs as much again as ax it contains is worth, and eepeekers find it economical to .

Amount of Honey From Pound of Wax.

The fact is, wax is produced from honey, just as tallow or lard is from corn, and is exactly the same kind of a product. The amount of honey which must be consumed in order to produce a pound of wax is variously estimated at from seven to twenty pounds. Conditions probably exert a considerable influence, which accounts for the difference in estimates. Ordinarily it is probable that about twelve pounds are required. White extracted honey is worth from 6 to 8 cents a pound, so it can readily be seen what it costs to produce the wax. But this is not all. The time consumed is worth at the time something more. Bees that produce wax cannot work in the fields for the time, but must keep comparatively quiet. To be sure, it is the young bees, principally, that produce wax, a certain amount of which would be secreted any way during the honey flow which is the reason why new swarms, composed largely as they are of young bees in good condition, are able to build comb so rapidly, and the reason why it was said before that when hived on full combs without supers one might not be able to get the most that they were capable of, yet beyond this a great deal is required to furnish a hive. To furnish an eight frame hive with full foundations costs from 50 cents up to 70 cents, according to kind and cost, while to furnish it in the natural way would cost much more. Old combs will save at least this much, and may be used repeatedly year after year, if carefully preserved when out of use.

Combs upon which bees have died may, of course, be unfit to use again, especially until disinfected. Ordinarily, however, we use them without hesitation, for we have no serious bee diseases to fear. If liable to be infested with wax worms we disinfect with sulphur fumes.

THE BUSY BEE.

Experience has shown that where farming can be profitably carried on bees can be a profit to their owners.

If a man keeping twenty-five colonies, more for their work as pollenizers, will multiply them to fifty colonies and give them the attention they require, he will be surprised at the large return they will give.

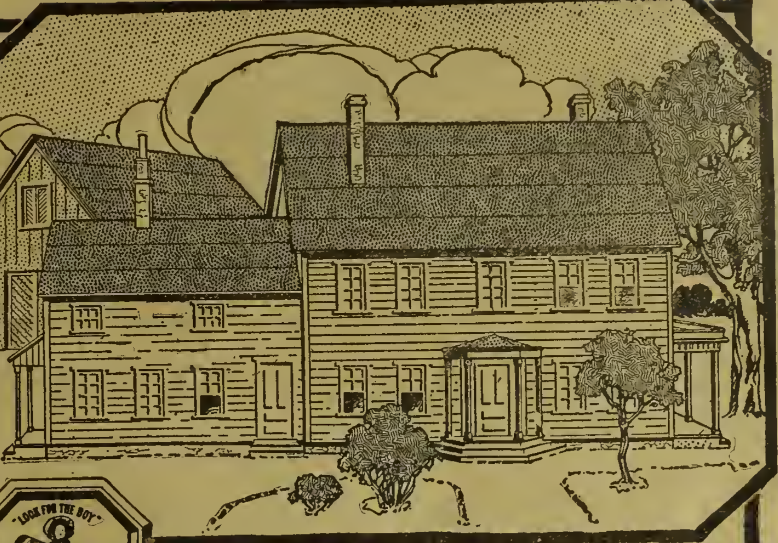
It is attention to little details that makes the difference between the successful beekeeper and the man who fails.

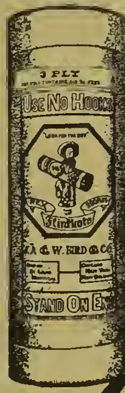
We have learned the secret of controlling swarming without having to de-queen our colonies with the consequent loss of brood; we have thought that only one queen could be present in a colony at a time, but recent experiments show that two or more can be kept in a colony at a time.

What is true of the big beekeeper is also true of the man who keeps but a few colonies, and a little better care, hitched to modern appliances, will increase the income to a very appreciable degree.—Farm Journal.

Germany is said to produce about one-fourth of the total honey crop of Europe. Her annual production is estimated at 20,000 tons.

If nearly every family owned its own home this country would never fall a prey to the anarchist, the revolutionist or the mere capitalist.





All Farm Buildings
should be roofed with REX—the all-round roof. It keeps the house warm in winter and cool in summer; it protects poultry from damp and extremes of temperatures; it guards stock and produce from wet; it defends buildings against the communication of fire by falling sparks and firebrands.

REX FLINTKOTE ROOFING

is made of long-fibre wool felt treated by our special process. It contains no tar or paper. Heat will not soften it, nor cold crack it. It is laid as easily as a carpet. Everything but the hammer is in the roll.

Intelligent Buyers
Appreciate Our Methods

Stores using the sensational special reduction and great discount methods are often considered low priced, while stores transacting business on a straight price system are assumed by many to be high priced. A little careful consideration will show you the error of this assumption and convince you of the advisability of buying under our system of pricing and selling, furniture, carpets and draperies.

Our Store Is the Low Priced Store

We have but the one price for all and that price is as low as it is possible to sell good qualities. If furniture is originally priced right there can be no special reductions or discounts. Stores employing such methods must price their goods high to provide for the great reductions. Such stores must then be high priced and you are paying much more than the goods are really worth. Our every day, plain figure prices are the right prices and are lower than you will find such goods priced elsewhere. We have the largest and finest stock on the Coast.

FERTILIZING STRAWBERRIES.

As is well known, the principal elements of fertility with which the strawberry grower is concerned are nitrogen, phosphorus and potassium, writes W. L. Howard, of the University of Missouri, in the Prairie Farmer. These elements exist in greater or less degree in all soils, but some sections are richer in potassium than others. Nitrogen is necessary in strawberry soils in order to produce thrifty plant growth, while phosphorus and potassiums are essential to the production of fruit.

It should be rememberd that while chemical analysis show the amounts of fertilizing elements in the soil the strawberry plants are unable to use all of it. In the first place, all the fertility in the soil is not available at one time, but becomes so gradusually through the processes of weathering, and the amounts thus set free are relatively proportionate to the amounts present.

When we apply fertilizer in the form of barnyard manures, however, we supply the elements in forms that are immediately available. This is also true of many of the mineral fertilizers.

By actual analysis, it is found that one ton of fresh manure from horse stalls contains, on the average, about 9.8 pounds of nitrogen, 3.1 pounds of phosphorus and 14.9 pounds of potassium. It would seem, then, if our figures are to be trusted, that this material, while not supplying a balanced ration for strawberries, does contain enough nitrogen and phosphoric for their needs, if applied in sufficient quantity. Barnyard manures are usually thought of as being particularlly rich in nitrogen.

This is true, but as has been shown, they contain considerable quantities of the other two elements, potassium, in fact, being more abundant than the nitrogen. While the potassium content in manure is very high, it is, nevertheless, insufficient to mature a good crop of strawberries in most soils, and, therefore, it must be supplied from some other source.

To get the best returns from strawberries the land should be made rich before they are planted. This is accomplished in one way, by beginning a year or two in advance and growing a crop or two of cowpeas and turning them under.

The phosphorus is placed far above the needs of strawberries, as shown by the analysis, because this fertilizer is likely to take insoluble form in the soil. The ammonia is placed low as top dressings are made in the spring.

In applying the fertilizers, plow barnyard manures and cowpeas under in the fall so that they will be well rotted by spring.

When rock phosphate (supplying potassium) is used, it should be broadcasted on the land in fall at the rate of 400 to 500 pounds per acre and turned under with the cowpeas or manure, as it is quite available in the presence of decaying organic matter.

The other chemical fertilizers used for strawberries are best applied in spring. They should be drilled in, if possible, just before setting the plants. Easily soluble materials like nitrate of soda or muriate of potash may be disked in wit results.

Never sow fertilizers direc the plants in warm weather they are in a green growing

If nitrogen above the needs plants is used, there will be cessive leaf growth at the of the fruiting. There is not danger of supplying too m phorus or potassium, so far as to plants or fruits is concern only what is needed will The rest is wasted.

If it is impossible to begin in advance, nitrogen may be s immediately by using sodium just before setting the pla rate of 100 to 200 pounds per

The same amounts of dri will also answer the same but it is not so readily avail is more troublesome to appl must be drilled in deeply s rot. It does not cost as mu sodium nitrate. Sulphate monia and cotton seed m supply nitrogen.

Phosphorus may be su using steamed bone meal at of 200 pounds per acre, dril will cost about $28 per phosphate at the rate of pounds per acre, sown b plowed under with manure peas in fall, as stated, woul good.

Potassium is best suppl either the muriate or sulp potash at the rate of 50 to 75 per acre, applied in spring j fore setting the plants. It about $52 per ton. Kainit—300 pounds per acre—would the same purpose, but it is no sirable.

Ordinary wood ashes may used like the other fertilize in the spring before planting about the plants. As much 50 bushels per acre may applied at one time.

The Ornamental Garden

THE AMATEUR GARDENER.

Doris wants a garden, now that spring
is almost here,
And she will doubtless get it—for
Doris is a dear—
A little bed, six feet by eight, with
roses and sweet peas,
She says she's sure that I can work
a plot like that with ease;
And I agree, because I find
To argue doesn't change her mind.

With pad and pencil she has planned
the little garden out,
Just where the mignonette will go
and where the pansies sprout;
What sort of border we must have,
and that geraniums
Will hold their bloom until it's time
to pick chrysanthemums.
It's fun for Doris. . . As for me
I've naught to do but just agree.

O'er catalogs we pore each night, se-
lecting what we feel
Will grow the best—and what the
neighbor's children will not
steal—
And every morning out we go into
the old back yard
To choose a spot where digging soil
won't be so awful hard;
For Doris says—bless her dear heart!
She knows that I will do my part.

But there's a thought that worries
me through all these prepara-
tions
For raising blooms and saving them
from youthful depredations,
I'd like to ask her if I may—and yet
I do not dare—
Plant something that is good to eat
out in our garden fair.
Will she permit me one small spot
For raising onions! I fear not.

—New Jersey Constitution.

A LILY BED.

I have lilies scattered all over the place, and have just decided that the big center bed in the drive, which has been given up to red gernaiums will be just the place for certain lilies which need resetting, says a correspondent in Florida Agriculturist. The geraniums are growing too big and coarse so that they may be relegated without compunction to the rear, then the bed shall be well fertilized and spaded. It does not need any drainage, as the ground slopes somewhat, and there is never any danger anyway of too much wet in this climate even for lilies. The big clump of Agapanthus which are not doing well on the west side because the umbrella tree has grown so large in the last three years that it shades it shall have the place of honor in the center of the bed. It throws out its delicate blue umbels from the last of June through August. It is well to know the months that lilies bloom, and to keep a memory of them, so that in making a lily bed one may have a constant succession of bloom, and also one must use discrimination in the choice of colors. In August the delicate shell pink Belladonna is in bloom, and as the Agapanthus is blooming at the same time, the two colors blend exquisitely, so I shall have a row of Belladonna around the clump of Agapanthus. The White Spider lilly blooms at this time also, but as it is a lower growing lily than the Crinum's, I shall put a row of Crinums around the Belladonas. Some of the Crinums are pure white, and some are white banded pink. They begin bloming as soon as the rains begin, and bloom at intervals until July. After them shall come the White Spider lilies which bloom in August. The outside row shall be the royal red Amaryllis. The huge red bed will take all my big, fat bulbs, but what a gorgeous display they will make early in the spring for a couple of months. The border of the bed shall have the pink, yellow and White Zeyphr lilies, some of which bloom in June, others in August, the white especially. And for the very earliest of blooms, I shall have a row of crocuses for the outside border. That will finish the bed of my choicest lilies. I have an idea that I shall fill in spaces with my delicate pink and slate-colored Gladioli, which are as beautiful as any of the lilies.

No Quarrel.

But this leaves me with the gorgeous orange-colored lilies which need a place to themselves where they will not quarrel with the surroundings, and their harsh beauty will be at the best. There is a space in front of the tropical corner where they would be effective. The background is composed of the feathery green of the Papyrus, the deeper green of the Umbrella plant, the white and green of the Arundo Donax, and the striped white and green of the Eulalia, while behind them all is the glossy green of a young pepper tree. The space for a bed here is not very large, but will be sufficient I believe. The double Tiger lilies shall have the center, and there are enough of the Superbum to make a row around them. Then the three varieties of Montbretia which bloom at intervals from early spring until September, and are various shades of yellow and orange, will fill in the rest of the bed, and for a border I will put in Freesias. This corner will be a study in shades of orange and green, and will, I am sure, be a satisfactory arrangement. I have had in my mind now for several months.

This leaves all of the very choicest lilies to be considered. There is the white Funkia, and the variegated Funkia and the Speciosums and the Auratums. They all need the coolest place in the garden. Some of them have been in the lath house where they have not done very well. Some have been on the east side of the house where they have not done as well, and some have been on the north side of the house where they have done better, so that I think the cool north side of the house will be the best place I can give them, and this bed shall be prepared with good drainage and fertilizer, and the lilies put in there along with the ferns which love this cool situation. When this is all accomplished, which will take some time to do, as I do not trust the transplanting to other hands than my own, my lily beds will be in shape for another three years, and in satisfactory shape at that, I am certain. The big Calla bed on the north side of the summer house has done so well that it needs no resetting.

The basis of successful rose growing is rich soil, ordinary good garden soil, well-drained and thoroughly and deeply spaded, enriched with manure or fertilizer. The soil can hardly be too rich, but the manure must be decayed and thoroughly incorporated with it, and the plants must be set in the soil, not in the manure as it is sometimes done. Well decayed sod, prepared in advance and forming a compost, is a valuable addition to garden soil. Careful preparation of the soil months in advance of planting will amply repay the care taken.

Irrigation and Forestry

THE CONFERENCE OF GOVERNORS.

THIS CONFERENCE will be the most remarkable gathering that ever met in the historic mansion. It will deal with problems upon which the continued prosperity of the nation vitally depends. For this reason its deliberations will be more fundamentally important and far-reaching than any since the days when the republic was planned. Never before have the chief executives of all the States met in one body presided over by the Chief Executive of the nation, and never before has there been a subject bigger or broader to cause such a meeting.

The steps which led to the caling of this conference are particularly instructive in the way in which they emphasize the close inter-relation and inter-dependance of all the natural sources of the nation's wealth and the fact that any attempt to conserve one set will soon involve the protection of others.

President Roosevelt Says:

The President outlined the scope and purpose of the conference in his invitation to the Governors, and emphasized the importance of the subject in the following words:

"There is no other question now before the Nation of equal gravity with the question of the conservation of our natural resources; and it is the plain duty of us who, for the moment, are responsible, to take inventory of the natural resources which have been handed down to us, to forecast the needs of the future, and so handle the great sources of our prosperity as not to destroy in advance all hope of the prosperity of our descendants.

"Facts, which I cannot gainsay, force me to believe that conservation of our natural resources is the most weighty question now before the people of the United States. If this be so, the proposed conference, which is the first of its kind, will be among the most important gatherings in our history in its effect upon the welfare of all our people."

Vital Problems.

All the sessions of the conference will be held in the historic East room of the White House, where so many other important scenes in American history have been enacted; and it is likely that President Roosevelt will not only open the conference, but will preside over all its deliberations.

It will be a conference in the truest sense of the word, with the single purpose of getting down to a practical working basis at once. To that end there will be an absence of set papers, though in order to open the discussion, a few recognized authorities will present brief descriptions of existing facts and conditions. It is hoped that plans may be so formulated that there will be immediate and concerted action on the part of the different States toward the conservation of natural resources, the fundamentally vital problem, according to the President, before the people of the United States today.

FORESTRY AS AN APPLIED SCIENCE.

Many people in this country think that forestry has never been tried until the government began to practice it upon the national forests. Yet forestry is practiced by every civilized country in the world, except China and Turkey. It gets results which can be got in no other way, and which are necessary to the general welfare. Forestry is not a new thing. It was discussed two thousand years ago, and it has been studied and applied with increasing thoroughness ever since. The principles of forestry are everywhere the same. They rest on natural laws, which are at work everywhere and all the time. It is simply a question of how best to apply these laws to fit local needs and conditions. No matter how widely countries may differ in size, climate, population, industry or gove provided only they have fore of them must come to forestr time as a matter of necessity.

Backward Nations.

The more advanced and prog countries arrive first and go f in forestry, as they do in other Indeed, we might almost take f as a yardstick with which to m the height of a civilization. (one hand, the nations which forestry most widely and sys cally would be found to be the enlightened nations. On the hand, when we applied our ya to such countries as are witho estry, we could say with a goo of assurance, by this test "Here is a backward nation."

A singular exception is En which, though provided with tain and heath lands capable ducing a large part of the w home consumption, has, with indifference, been leading al in volume of wood importati depending mainly upon sources for her supplies. has hitherto been able to cou certainty upon outside aid fr near neighbors as Norway Sweden. This policy has satisfactory to the people in the examples of a more p policy afforded by rival n most at her door. The geo and economic position of th have permitted the govern the time at least, to ignore found necessary for the pu fare in other countries of th rank.

Spur of Want.

The countries of Europe and taken together, have passed all the stages of forest history, plied all the known principles estry. They are rich in forest iences. The lessons of forestry brought home to them by knocks. Their forest system built up gradually as the hardship. They did not first theories and then apply th

roses? Both last year's and
ar's roses have what looks like
eaf;" the leaves curl up and dry up. Also what am I to do for insects on roses?—Mrs. A. G. C.

We assume you are troubled with mildew. Scatter a handful of flowers of sulphur over and under the vines. This will not cure the leaves now affected, but if treatment is continued the new growth will be saved. As the season gets warmer this trouble will not be so bad. Strong soapsuds will kill the aphis on the new growth. Or you may use the tobacco decoction as given in the issue of March 12.

Transplanting Olives.

Can you tell me if olive trees eleven years old can be transplanted? If so, what would be the best method, and at what time of year could it be most safely accomplished? —W. E. H.

The olive is very hardy, and it is probable that by cutting the top severely, cutting nearly all off, you can reset the trees. Of course by lifting with a large ball of earth and moving with great care you may save most of the top. This requires a derrick and is expensive, too much so for a commercial orchard. They may be moved at any time for the next month or so. Cut at least two-thirds of the top and save as much root as possible. Cut off all mutilated roots, have hole plenty large and all ready, so as to leave roots out as short a time as possible, then flood as soon as planted with water. Irrigate again a couple of times at intervals of two or three weeks. It is better with old trees to set the same side to the south as the tree originally stood.

Grape Cuttings.

In a recent issue of the Cultivator J. W. Mills says that grape cuttings planted deeper than ten inches or a foot will rot at the lower ends in the clay soils of Imperial valley. He goes further on and says, when planting in vineyard form they should be 18 inches or 2 feet long. Why the difference? Will Mr. Mills or somebody explain through the Cultivator. —A Subscriber.

The article was not strictly an Imperial one. On the sandy soils of Southern California, in the San Joaquin and Sacramento valleys, an 18-inch cutting is best when planted in vineyard form. I planted a small experimental vineyard on the Alamo river in the Imperial valley where the soil is considered by the farmers as a sandy loam, and the lower ends of the cuttings rotted off. The same thing happened to the fig cuttings. These cuttings were only a foot long with the tops about an inch above the surface of the ground and they dried out below the top bud. The roots came out from the center of the cuttings that grew. A good percentage of them did not grow. The sandiest soils of the Imperial valley will hold water like a tub when irrigated too often, and it is not always possible to apply the water as it should be. For example, in the case cited the surface of the soil was dry and the tops of the cuttings were drying up when the owner was preparing to irrigate. He examined the lower ends of the cuttings and found they were in saturated soil and were beginning to rot, something I had never seen outside of that valley.—J. W. M.

Hardpan.

I am working an orange grove, one corner of which, say 100 trees, are yellow and small top, and partly dead. The former worker says that the standpipe was not high enough to carry sufficient water to this part. I have taken out some of the worst, and found that I could cut a few little roots on one side and then take hold of the tree and pull it over—just a few surface roots. There is hardpan underneath at six to ten inches from surface which is six or eight inches thick. Did lack of water cause it? Will water and cultivation remedy it? A Reader, Rialto.

The character of your hardpan cannot be told from your description, excepting that we infer that the remainder of the orchard which had plenty of water is all right. In case the high corner has simply a "plow sole" hardpan, subsoiling with plenty of water will correct conditions and a good orchard may be made on that ground. If it is marl hardpan it is a harder proposition. A few holes dug through, noticing how it acts under treatment with water, will soon inform you how to handle the soil. The trees which are now there, if stunted, will probably never make the most productive orchard. New trees, given the best of care, will probably do far better.

CASABAS. Courtesy Johnson & Musser Seed Co.

If it is a marl hardpan, blasting out is probably your remedy.

Dust Sprayer.

Where can I get a bellows or arrangement by which I can blow sulphur on vines? M. A., Fresno.

Write Baker & Hamilton at San Francisco, Sacramento or Los Angeles or the H. C. Shaw Co., Stockton.

Figs.

Will you kindly give me information concerning the "Kadota" fig—size and quality of fruit, when same ripens and its commercial importance; also would like to know the best fig to grow for fruit-stand trade. Can I get a book descriptive of the various kinds of figs? C.R.

The Kadota is a good fig, very sweet and of fair size. It is in the Smyrna class and we are told but little afflicted with souring. The best fig for fruit-stand trade is hard to say, though the black fig, common Mission, has sold well. It bears extremely heavy and does not sour. Of course a small number of trees will supply a market so that great plantings of them should not be encouraged, except where canneries will take the surplus for marmalades. For drying, the true Smyrna is the best. "The Fig, Its History, Culture and Curing," may be had if not out of print by addressing Department of Agriculture, Washington.

Dog Bites.

Please tell me whether the owner of a dog is liable to an agent or solicitor who may be approaching the house, in the walk or drive, but on the dog-owner's property, if the dog bites or injures the solicitor.—J. Black, Los Angeles.

The owner of dog would be liable, providing the agent is orderly and in regular walk or drive to the house. While it is the property of the dog-owner, yet the public are supposed to have rights of entrance or departure from the place.

Planting Near Line.

Will you kindly inform me through your valued column "Queries and Replies," what the lawful distance is for planting eucalyptus trees off a line, between neighbors, or how far should I stay on my land with them along a line? E. L. H.

You may plant as you wish if entirely on your own land. Your neighbor may cut off the roots if they trespass. See answer to "New Beginner" in "Trees on Line."

Line Fence.

Where a land-owner builds a fence on the line between himself and his neighbor on his own expense, will the neighbor ever have a lawful right to half interest of the fence without paying for the same? A Subscriber.

Line fences are built at expense of both parties. If, however, one party leaves his land unfenced, then the other may build on the line and then later, if the other owner decides to fence his field, then "he must refund to the other a just proportion of the value of the division fence at that time." If, on the other hand, a party wishes to build a "line" fence and still retain entire possession of it, he may build entirely on his own land and then change or remove at will.

Trees on Line.

Is there any law regulating planting of gum trees along a line fence. If so, how far from the fence can anyone stop me from planting if I choose to plant 6 feet from the line? A. New-beginner.

No one can stop you from planting trees six feet or one foot from the line. However, if you plant close enough to the line so that as the trees grow the trunk stands over the line, then they are the property of both owners. But if on one side of the line, they belong to that property, even if the roots extend over the line. Of course the other property owner has the right to cut all roots which encroach on his land if he wishes.

Orange Seed-Bed.

Kindly inform me as to the best method of planting and care of young citrus seed-bed stock, when it has to be taken from the seed-bed and planted in rows in the field. What is the best time for planting and how deep should the young slips be placed in the ground. Is it necessary to fertilize? Chas. Donnelly.

Mr. Mills gave an article on this subject in answer to query in issue of Jan. 16, on page 74. In a word, plant seed soon. Transplant seed-bed stock in nursery row next year, bud the following fall or the next spring. Then plant in orchard when buds are one or two years old.

Army Worms.

How may I control the
cut worms? S., Gardena.
See article by Mr. Pease

ood Dry Season Advice

y farmers are so situated that they have a piece of land "above the ditch" wish information on how to plant various crops, "Dry Farmer" will answer the Cultivator. Mr. Musser, who is the "Dry Farmer," has had experience s whereof he speaks.

CHERS are all wishing for least one inch more of rain-; while it is possible we will et it is just as possible that ill be no more rain this sea- ne barley fields look good, use of the late rains the seed getting in and consequently e yet young, and without in the barley will either die er or head out without growth. In this event there a deplorable shortage of hay dairymen will be pinched the for feed.

this dry winter, one dairyman what he shall do for feed for s. I advise him to plant Ger- llett if he has enough water to his field thoroughly before in the seed. About the first he did as I advised and grew one ton of hay to the acre and a second crop for pasture, and saved his dairy.

Next to millett I would recommend sugar cane and Kaffir corn. There are other similar crops as Egyptian corn and Pearl millett, but these grow too coarse when the seed grows to a head, but they are good when young.

SPINELESS CACTUS.

If there is any waste land on your ranch, now is the time to start a bed of spineless cactus, and in a few years you will be ready for any dry years. Cactus should be planted any time after May first; with a little water to start the roots it will at once take care of itself, and a few acres will go far toward tiding over a dry year.—Dry Farmer.

tages.

ghly those countries which to- nanage their forests on sound oles have passed through four of forest experience. At first rests were so abundant as to be way, and so they were neither ted or destroyed. Next, as set- nts grew and the borders of the receded farther and farther he places where the wood was l and used, the question of local supply had to be faced, and the was spared or even protected. the increasing need of wood, er with better knowledge of the and its growth, led to the nition of the forest as a crop, gricultural crops, which must be ted and which should, there- be made to grow again. In this silvi-culture or the management e forest so as to encourage its nued best growth, was born. ly, as natural and industrial ess led to measures for the gen- welfare including a wiser and wasteful use of natural resources, forest was safeguarded and con- d so as to yield a constant maxi- product year after year and one generation to another. matic forestry, therefore, applied he nation for the benefit of the le and practiced increasingly by ighted private citizens, comes the last lesson in the school of st experience is mastered.—San Times.

OSSIBILITIES OF WALNUT BLIGHT CONTROL

Continued from First Page.

Will be Permanent.

et us now consider especially the sibility of blight control by the use mmune or resistant varieties. The stion of obtaining an immune or stant variety is not a vague dream of the future but is a reality of today. We actually have varieties that have, to our own knowledge, completely escaped the blight year after year. There is no reason to suppose that this character cannot be perpetuated by either grafting or budding. After carefully considering all possible methods of blight control, we arrive at the ultimate conclusion that the use of immune varieties is the only rational method of blight control. Immune varieties is a thing of permancency, while spraying is but a temporary remedy at the best, an operation that will have to be performed year after year. We would consider ourselves very much remiss should we recommend any temporary, uncertain method of blight control by spraying, when there exists not only the possibility of obtaining immune varieties, but the actual realization of that possibility. We know today of at least half a dozen trees which, for all practical purposes, are blight immune. The question then arises, why and how are these blight resistant? From all that we can gather, most of these trees are immune or escape the blight because they are late in coming out in the spring and escape the worst infection period.

There are a few exceptions where the trees come out as early as the average Santa Barbara soft shell and still are practically immune. These are trees which truly can be said to be actually immune. The fact that experience has proven that these trees are immune, because of their lateness in coming out in the spring, should not in the least detract from their value for propagating purposes. What we want is that they escape the blight.

Must Also Be Good Nuts.

While we require blight resistance, we also want trees that will produce a good quality and quantity of walnuts. It is also desirable that they mature in the fall as early as the average seedling, so that they may come into the market at a season when the demand for walnuts will bring the maximum price. Some of these immune trees not only produce from one hundred to one hundred and fifty pounds of nuts per tree, but are of a very desirable quality and coming to maturity in very good season. So while requiring blight resistance we also ask that they meen the other requirements as to season, quality and productiveness.

* * *

Go Slow.

In any consideration of walnut blight control by the use of resistant stock there are always two phases, the present and the future. The control of blight in the orchard to be planted in the future, we feel sure will be practically accomplished by the use of resistant stock. This phase of the matter lies largely with the alert, progressive and honest nurserymen, and has been fully discussed this morning. Suffice it to say that it is well to go a little slow at present, until the resistant qualities have been more thoroughly tested, and until there shall be available for commercial distribution, grafted trees from known and tested resistant stock.

The budded trees from the "Eureka" tree at Fullerton have up to date been sold largely to one or two large growers, and as they have taken all the available supply of these trees for the last three years, they have not been generally sold or distributed. There has been much talk about using French stock, especially the Franquettes and Mayette in the south, as they are more or less resistant; largely because of their lateness in coming out. The popular and general opinion seems to be that they are rather shy bearers, at least here in the south, though I am not sure that it is based on facts.

There are very few bearing Franquette and Mayette trees in Southern California; in fact, hardly any worth mentioning, nor enough to base an opinion on one way or the other.

General Agriculture

THE EUROPEAN GRAIN TRADE.

Notwithstanding the great increase in our flour exports to the Far East, the United Kingdom alone requires far larger quantities of American flour than all Asia. In the grain trade the preeminence of Europe as an outlet for our surplus production is more marked, between 80 and 90 per cent. of the total wheat and corn exports from the United States being destined to that continent, while the United Kingdom alone buys annually about one-third of our entire shipments abroad of those grains.

The European Grain Trade is the latest subject investigated by the Bureau of Statistics of the Department of Agriculture, a bulletin under that title, prepared by Frank R. Rutter, while Assistant Chief of the Division of Foreign Markets, having just appeared. This bulletin, giving comprehensive statistics of the European imports and exports of grain and flour for a long period of years, compiled from the official statistics of the various countries, supplements a recent bulletin covering the grain production of the United Kingdom and the various continental countries.

While the United Kingdom, of course, holds first rank as a market for foreign grain, the rapid increase in the requirements of Germany is perhaps the most striking feature disclosed by the trade statistics. Within the last twenty years Germany has risen from sixth to second place among the wheat-importing countries of Europe. At the present time Germany has to depend upon importation for more than one-third of its total wheat supply.

At the same time that western Europe is providing a market for our surplus grain, eastern Europe is increasing the force of its competition. Russia, while continuing to grow enough rye for its own consumption, is constanly increasing th acreage on its larger estates consequent surplus available tation in years of normal During the first five years of tury the average wheat expo Russia reached 141,000,000 showing a gain of 40,000,000 as compared with exports years earlier.

Hungary, the second large ter of wheat in Europe, ships plus almost entirely to Au that Hungarian wheat ente strictly foreign trade to a very extent, and then almost solely form of flour, the product of th garian mills being of an exceptio high grade.

Roumania ranks third among surplus-producing countries of Europe nearly one-half of its total crop being shipped abroad. There, as in Russia, the increase in wheat acreage is taking place almost entirely on the large estates, while the smaller growers content themselves with raising corn, the great mainstay of the peasants in the Danubian countries.

LCOHOL AND GASOLINE.

comparative values of alcohol asoline for light and power, pub- by Iowa State Experiment Sta- ve note the following summary:

Investigations of which those eported form a part were under- "for the purpose of making a rison between (1) the heat value fuels, (2) their economy in the tion of light, (3) their economy production of power, and (4) lative safety of alcohol and gas- for general use.

lies of illuminating power were with three forms of gravity , a wick gasoline lamp, a pres- ver-head generator lamp, and an ry kerosene lamp. The tests wer production were made with different makes of gasoline en- having ordinary compression ires. It was found impossible to e an engine especially designed cohol, "and it was further found ically impossible to properly al- he design of any of the larger ne engines found in the labora- for the most advantageous use of ol."

results obtained are summar- as follows:

) The higher heat value of 94 ent. alcohol is but 68 to 71 per that of gasoline.

) The lower heat value (the value nearly attained in practice) of r cent. alcohol is but 66 per cent. per cent. that of gasoline.

) When used for the production ght, 94 per cent alcohol will pro- from 53 per cent. to 85 per cent. uch light as an equal volume of line.

) Alcohol of 94 per cent. purity be sold for from 11 to 17 cents allon to compete with gasoline for ing purposes at 20 cents per gal- (the present retail price of gaso- here).

"(5) Alcohol, when used in a generator lamp, will produce from two to four times as many candle power hours as kerosene in a wick lamp.

"(6) It was found impossible to soot the mantels of any of the lamps with alcohol.

"(7) Alcohol of 94 per cent purity, when used in engines designed for gasoline, has but 68 per cent to 85 per cent the value of gasoline in the production of power.

"(8) To compete with gasoline at 20 cents per gallon for use in gasoline engines, 94 per cent. alcohol must be sold for from 13 to 17 cents per gallon and 90 per cent alcohol from 11 to 15 cents per gallon.

"(9) None of the engines could be started readily with alcohol, although a few could be started with less difficulty than others.

"(10) After having once been started with gasoline and warmed up, the carburetors as designed for gasoline vaporized the alcohol successfully, except in one instance.

"(11) No doubt the gasoline carburetor can be readily changed to permit the use of alcohol as well as gasoline in the same engine.

"(12) Experimental work does not include tests of the special designed alcohol engine which should show better economy in the use of alcohol.

"(13) Gasoline cannot be used readily in a special designed alcohol engine using high compression on account of pre-ignition.

"(14) The odor of the exhaust of an engine when using alcohol is not as unpleasant as when using gasoline.

"(15) Alcohol is much more pleasant to handle.

"(16) There is much less danger from fire when using alcohol than when using gasoline, owing to the fact that alcohol does not vaporize as readily as gasoline and its flame may be extinguished with water."

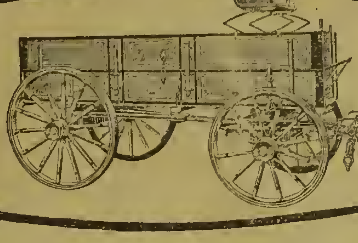
PUSSLEY.

Pussley or purslane is an annual and if it is not allowed to go to seed for a number of years or till all the seed that is dormant in the ground has germinated, it will be overcome. It never starts from the roots of last year's growth. The seeds are very vital, however. Professor Beal, of the Michigan station, states that he has known the seed to retain vitality, when buried deep in the ground, for 25 years. It is claimed by some that one plant is capable of producing as high as 1,250,000 seeds. If this is the case and it is possible for seeds to retain vitality as long as Professor Beal says they can, it is well nigh impossible to eradicate the weed, no matter if every one is prevented from going to seed during the years the ground is cultivated.

Pussley does no great injury to the corn field. In fact, the writer sometimes thinks it is a blessing. It does not make its principal growth till after the corn is ready to shoot so that it takes but little moisture needed by the corn. Its trailing habit and excessive growth affords a covering to the ground, thus preventing the loss of more moisture by evaporation than is lost through the plant. As a hog feed, when the pasture is drying up, there are few plants that will be eaten with a greater relish.—Agricultural Journal.

The 1907-08 citrus fruit crop of Florida is unofficially estimated at 2,295,072 boxes, against 3,826,018 in the season of 1906-07.

THREE HIGH CLASS FARM WAGONS



A FARM wagon has much hard work to do. It must haul heavy loads, travel over rough roads and be out in all kinds of weather. When you buy a farm wagon you want to get many years' service from it.

You will not be disappointed if you buy any one of the three wagons described below.

The 63-Year-Old Weber

The King of all farm wagons. Only the very best and most thoroughly seasoned wood is used; ironed to make a wagon that lasts a lifetime. Light running, convenient and a wagon of fine appearance.

The Popular Columbus

Built in a factory where most exacting conditions are enforced. Air seasoned wood stock, ironing which gives great strength and durability, workmanship by thorough mechanics and every part thoroughly tested.

New Bettendorf Steel Gear Wagon

Front and rear gears made of steel. Parts riveted together, not bolted. A wagon that is proof against breakdowns. Nothing can work loose or rattle, and there can be no warping, drying apart, shrinking or rotting.

You should remember above everything else that a cheap, poorly constructed wagon is dear at any price.

Before you buy any wagon call on the International local agents and learn all the superior points of the Weber, Columbus and New Bettendorf wagons. They will show you the wagons and hand you printed matter giving all particulars. Or if you prefer write nearest branch house for full information.

PRODUCE MARKET.—Los Angeles Market; San Francisco Markets; Citrus Markets, 438, 439.

SPECIALTIES IN FARMING.

We are in receipt of a letter from a gentleman who was present at Whittier when we spoke on experiment station work before the Farmers' Institute. He asks, "Do you think a farmer can make a success of special farming in this State?" We do. If a farmer selects a single branch of industry and follows it intelligently he can not fail to make a success. On every number of the programme at the Whittier institute, farmers who have made a success of specialties gave their methods of carrying on their work. This was true in the vegetable industry, and it was noticed that those who have succeeded best were those who have confined their efforts to some particular line. Lambert with onions, Neff with walnuts, Chase and Ramsey and others with oranges and Leffingwell and Teague with lemons.

As a general proposition it may be stated that every farmer ought to be thoroughly master of some branch of his business that he can do that work better than any other, or than any one can do it for him. What it shall be must depend on himself, his tastes and his adaptation. But when once chosen he should be master, learning everything there is to know, so far as he is able, and keeping in the forefront of improvement along the line he has undertaken to follow. He should, in fact, make it his specialty. Unless he does this he had better not undertake to farm at all, for in this age of sharp competition only the man succeeds who is able to produce better and cheaper than his neighbors. The slovenly man has no business to try farming because, when he falls into a rut and slums along, he will work hard through the year with no profit at its close.

In this development of specialties the farmer will follow the simple rule of business avocations and succeed in proportion as he understands what he is endeavoring to do. The merchant who specializes, if he is up-to-date, gets on for now days specialties in any business on the things that pay best.

We know a cattleman who went into the business of breeding high grade shorthorns. He had been for years a general farmer, plodding along and succeeding only fairly, but he turned his attention to one branch of the cattle business to the exclusion of all others, and today can draw his check for $100,000. He has made good while his neighbors have just about "held their own."

Farming as generally conducted just about earns a nice living. When some particular industry is selected and followed, with all the sources of advantage it possesses, it becomes highly remunerative. Then, too, the individual who learns the secrets of a specialty and become master of them, is able to command his own price if he prefers to work for others to working for himself. The more difficult the specialty is to master, the more secure will be the control of it by whoever has once gained a knowledge of its intricacies. This does not mean, as Sterling J. Morton once said, when he was Secretary of Agriculture, "that the farmer who masters a specialty becomes in any sense a monopolist. For whatever the farmer is able to produce the demand is world-wide, provided there be enough producing it to make a world supply."

We have all observed in California that specialties belong more to individuals than to localities, although what one man in a neighborhood has been able to do is often attempted with mediocre success by others. Still the individual who makes the greatest achievement is the one who is the closest specialist. But there is always much to be gained to a community by example, and the result of this larger production is to stimulate farmers to try to emulate, thus elevating their own standard of production with advantage to each other.

Whenever a farmer in any locality sets the example of growing some specialty and making it profitable, he at once adds to the value of the land in his neighborhood. What one farmer can do another in like circumstances can imitate, even if his imitation should fall short of the model produced by the originator. But if the originator of the industry keeps himself posted in his specialty, it will be easy for him to produce more cheaply than is possible for his competitors and at the same time to enjoy the pleasure which a sense of mastery always carries with every enterprise.

THE OMINOUS RUMBLE.

Talking the other day with one of the oldest men of the present generation, who lived a very active public life in Illinois for 60 years, about the business depression now manifest in most of the leading industrial centers, he gave as a reason the "law of reaction;" said he:

"It was not the President's big stick, nor the manipulations of Wall street financiers, nor yet the rottenness of some of the New York banks, that suddenly turned the flood-tide of prosperity into a disastrous ebb, carrying with it much wreckage. The stoppage in business and the collapse in values were not so sudden and unexpected as they appeared to the superficial observer. Those who had their ears to the ground heard the ominous rumble months ago, and were prepared for what has come." It was the natural working of the law of return, the swinging back of the poised pendulum of business over activity.

Well, our venerable friend may be right, but we do not altogether agree with him. The President's "big stick," in our opinion, caused a summary halt in the widespread open excesses of the lawless monoplies; the insurance companies, Standard oil and the rotten New York banks. Then, too, we have been living to fast. It was time a halt was ordered by some one, else the fate of Sodom and Gomorah were sure to overtake us as a nation. But, of course, the depresion might not, in its entirety, be wholly due to these causes for wiser men than o seem to see only the working of the toleral lar twenty-year cycle which brings aro panic as the aftermath of prosperity. T nous rumble, however, always precee storm We heard it a long time bef storm broke, but we didn't heed it. We expecting such a sudden and far reaching to our many years of unprecedented business activity.

If there is anything in cycle moveme of course, the present industrial depressi the anticipated, and those who were with the panics of 1837, 1857, 1873 and 189 fully prepared for what occured in 1907

Why?

The explanation is apparent if we atta significance at all to the cycle proposition. in that space of time, after every nation pression, a new generation of busine takes the place of the elders, and workin new era of prosperity, establishes new not only in business expansion, but in corporate, municipal and national extrav which continues until the expansion reac utmost limit; and then comes the inevit lapse, and we enter upon another season o omy and repentance and the practice trenchment, which lasts until a new gen of industrial and financial captains inau a new era of expansion and extravagance in part, at least, appears to be the condi the present financial depression. We can together disabuse our mind, however, thought that the President's "big stick open the rottenness of the malevolent c tions and called a halt to their iniquitou ceedings. At any rate we shall profit generation by the experience we have ha generation to come will take its medici if there is any such law governing hu fairs as the reoccurence of twenty-year in business conditions.

WHERE CO-OPERATION COUNTS.

An Illinois farmer who was ind send 50 barrels of apples to Liverpool un promise of exceptionally good profits. h ceived his return in red ink. Naturally sore. He blamed the commission ma then the transportation companies and got round to the real cause of his undoin was the foreign market.

The transportation companies, of c up the largest part of his expected prof commission men took the balance, plus s more. Here is where co-operative f might have saved a fellow grower. H Grange been situated so it could have h this fruit, the result might have been d It seems to us, as the Farm Journal "there should be a satisfactory and symp intermediary between the producer and t sumer." In some States there is this prov of safety, but not in all.

This can be said without impugning th ods or morals of the commission men who rule, are entirely reputable and few o find fortunes in handling such perishabl ucts as fruits. If the farmers of a neigh to the number of thirty or forty or more to join together and employ one of their to handle their products in the nearest town, it might be possible to secure much ter prices than are now obtained. By method all the expense, save the cost of taining the selling end of the business, wo cut out, and all above that would be retu the producer.

We have before referred to the plan wh being put in operation by farmers in States, that of building warehouses and houses and selling direct to consumers wi the intervention of middlemen. The plan lieved to be feasible.

FARMERS' INSTITUTES.

J. B. Neff, conductor of Southern Calif nia Institutes, announces institutes as follow Highlands, May 11 and 12; Rialto, May 13 an 14; San Dimas, May 15 and 16.

I was glad to read the editorial in the Culti tor calling for protection of the meadow lark writes J. B. H. this week.

Bakersfield hopes to have a Kern county fair this season.

Extensive plantings of eucalyptus are being made at Wasco.

Apple growers in the Santa Clara valley are spraying for codling moth.

Present prospects for the cherry crop in the Santa Clara valley are good.

The prospects of the Corcoran asparagus farms are said to be very promising.

The prune crop about San Jose promises to be a record breaker from present indications.

The California Fruit Canners' Association contemplates establishing a cannery at Kingsburg.

There are 13 creameries in Tulare county selling over $200,000 worth of butter and cream per month.

Palo Alto citizens are to form an Improvement Club for the purpose of beautifying and improving the roads.

Beautiful weather was given to the Santa Clara valley people at their prune blossom festivals held recently at Saratoga.

One of the most remarkable wells has been sunk at Zante Heights, which gave a good flow at a depth at 67 feet depth.

The peach moth has been discovered in the orchards of Kern county and much concern is felt on the part of the growers.

The members of the Farmers' Educational and Co-operative Union met at Selma last Friday to form the Fresno County Union.

The Pajaro valley Board of Trade is making an effort to accomplish much good for that section and urges all farmers and fruit growers to support it.

The Locust Grove Ditch Company at Exeter recently elected officers for the coming year. The president is B. F. Teague, secretary H. T. Anderson. Other directors are John Tuohy, J. S. Glenn, J. W. McCutchan.

The Central California Produce Company of Turlock which is an organization of farmers for the marketing of products of that section, is interesting a large number of Chicago houses and hopes for a favorable season.

Hatfield claims that the shortage of rain this year has been caused by his being unable to secure the proper chemicals from the East. He expects to soon receive a new supply and rains are promised as soon as it arrives.

The campaign of the Sempervirens' Club and others in the neighborhood of the Big Tree Basin Forest Reserve south of San Jose, has resulted in the declaration by the State Forestry Commission that not another redwood shall be cut within the confines of that park.

Lemon Cove orange growers are very much exercised over the fact that orange picking boxes have been brought to that section from orchards infested with White Fly. The boxes were promptly burned as soon as it was discovered, but it is feared that some of the pests may have escaped.

Southern California

Fullerton has an output of 14 cars of cabbage per week.

A new creamery has just been established at Redlands.

Cutworms have already appeared and some early vegetables have suffered.

Cantaloupes are in bloom and an early harvest is promised in Imperial valley.

It is now claimed that the Salton Sea is only two inches lower than it was one year ago.

Orange county has placed upon the market during the last four years 1000 tons of dried chilis.

Celery growers at Wintersburg held a meeting last Friday to discuss methods of spraying to control celery blight.

One nurseryman at Redlands has contracted for 300,000 Rostrata for planting in the Imperial valley this season.

The county seat contest at Imperial between El Centro and the town of Imperial, is now in the courts of Los Angeles.

Navel oranges in some of the earlier sections are beginning to drop, which will cause some little loss to the growers.

A few oranges have been forwarded which have become a little "soft," but as a rule, most fruit has been in fair condition.

From present indications the present grape crop of Imperial valley will be fully as early as last year, which was June 10th.

Celery growers recently met at Santa Ana and received information from Prof. Smith as to procedure against celery blight.

A large chili grower of Santa Ana has been investigating the chili prices and conditions of the market up the coast and finds a discouraging outlook.

The Orange County Farmers' Mutual Fire Insurance Company recently paid its first loss in two years. The company is said to be in prosperous condition.

G. Harold Powell, pomologist of the Department of Agriculture, is investigating shipping conditions in the cantaloupe industry in Imperial and Coachella valleys.

The owner of the patent for walnut bleaching compound is filing suits against La Habra Walnut Growers' Association; also the Santa Paula Commercial Company.

The quarterly meeting of the Tri-Counties' Reforestation Committee was held at Riverside on April 1st. A report was made by chairman Cuttle of his efforts at Washington.

J. G. Baum, of Olive, has developed a potato which is said to be earlier by two weeks than other varieties and an exceedingly heavy bearer, running at least 150 sacks per acre.

Redlands Citrograph says: Just as a sample of what can be done by a Redlands navel orange tree when it gets good and ready, Burges Smith took a 24-ounce orange to the board of trade rooms Wednesady. It measured 14 inches around the waist. It's not the biggest one ever grown here, but it's big enough.

The Coast

Today, April 9th, is Arbor Day in Washington.

Highest priced wheat since last fall is the condition at Palouse, Washington.

Wood buyers at Pendleton, Oregon, predict lower prices this season than last.

Orchardists at Wapato, Washington, are having great difficulty in securing labor.

McMinville, Oregon, is to have a modern milk condensary as soon as it can be built.

Oregon prunes are commanding a slightly better price than they did a few weeks ago.

The Portland Oregonian appeals to poultry raisers to raise twice as many fowls as last year.

The Yakima valley, Washington, orchards promise a bigger return this year than last year.

Fruit men at Roseburg, Oregon, recently formed a Douglas County Fruit Growers' Association.

The Northern Pacific has made a cut of 10 cents per hundred in shipping rate sacks to farmers.

Apple growers in Washington, as a rule, are preferring the arsenate of lead for control of codling moth.

Farmers at Pendleton, Oregon, are buying automobiles, one firm recently selling 10 machines, all to farmers.

One stock farm at Twin Rivers, Montana, has over a thousand young horses which are being trained by 25 trainers.

Arbor Day in Oregon is to be observed April 13th. Its observation this year will be more general than heretofore.

Prune growers at Salem, Oregon, are making an effort to put up a better pack of prunes than during the last season.

Loggers at Vancouver, British Columbia, will be allowed to export to Puget Sound the big supply of timber now cut.

A tract of several hundred acres has been purchased at Brewster, Washington, for establishing a large commercial nursery.

The Spokane Review of Spokane, Washington, appeals for a big Northwest farming congress to be held next fall at Spokane.

Children in the Albany, Oregon, schools are offered prizes for the most practical work in connection with the study of agriculture.

The campaign of dipping sheep for ticks at Pendleton, Oregon, has been so successful that many flocks are entirely rid of the troublesome pest.

A fruit growers' special train with a corps of lecturers from the State University, went through various parts of Washington and held a series of valuable institutes.

Many crops will have to be reseeded at Washtucna, Washington, because of a hot wind shooting across that section and destroying all the growth of the young crops.

The State Board of Control have fixed the price for penitentiary grain sacks at Olympia, Washington, at seven and two-tenths cents, which is a material reduction from the nine cents of last year.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland:
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis & Clark Exposition."

Profit in the Poultry Ya

We solicit short articles of a practical nature from the fancier and ... **ity breeder, giving their experiences with poultry. All inquiries pertaining to ed management, disease and its prevention will be answered through these colu ns**

CLEAN UP HOUSES.

BEFORE the hot weather sets in it is well for all of us to be ready to take care of the numerous parasites that come with the hot weather. Dr. Salmon in his book "Diseases of Poultry," gives a list of over forty different kinds of lice and mites that infest our fowls. It is not necessary for us to study the characteristics and names of each of these, but it might be well for us to know how to exterminate them, or to keep them from getting start enough to make life miserable for us as well as our birds.

Prevention Best.

Be careful to keep houses clean and whitewashed—inside walls, roosts and dropping boards.

Besides, provide a good dust bath for birds and we may feel reasonably sure that we will not be bothered very much with lice. But if we let them get a good start we will have to use vigorous methods to rid houses and fowls of them.

Mites Worse Than Lice.

The most dreaded of all is the little red mite. As soon as the season is fairly started we begin to get letters asking for advise in regard to exterminating the red mite. This pest is particularly fond of dirty houses and a broken egg in the nest either during incubation or in the laying nests if left alone makes a favorite place for the mite. After they get a start they lay their eggs in cracks and crevices of houses, on under side or roosts and in nest boxes. These eggs soon hatch out and either prey upon our fowls when on roosts or our sitting hens. They will sap the vitality and profit from the entire flock. One can easily detect the mite as their eggs, which look like little white specks, can be seen on roosts and walls of house. If these specks are detected you may rest assured that you have this very interesting and annoying pest.

Treatment.

Fumes of liquid lice killer or insect powder will not kill the lice, but we can get rid of the lice and mites either with paint or by whitewash, as a good coat of either will kill them as well as the eggs. Spray the houses well with chloro-naptholeum, about one pint to four gallons of water will exterminate them, but to rid the place of them a second or even a third treatment should be given at intervals of about one week. If we will keep our houses clean and spray or whitewash, give the birds a chance to dust themselves, we will not be troubled, besides the health and vigor of the flock will be a great deal better.

AROUND THE YARDS.

Shape makes the breed—color the variety.

* * *

Don't forget to spade up the runs; it gives the birds something to do scratching for bugs.

* * *

The poultryman who will succeed must meet failure and disappointment with an unflinching determination to win.

TURKEY TALK.

A great many write to as my turkeys run where they and select their own nests. tainly would not want to go b the old-fashioned way of r turkeys, letting them lay away the field where the crows woul all the eggs. I prefer not over hens in a flock with one tom, an they are kept in a grass yard of or three acres they will do ju t well as though they had the ran the whole farm. When turkeys kept in this way it is easy to the eggs and they can be gath two or three times a day. Then can set your hens in large boxe keep them shut on their nests, ting them out only every other for a little while, and when they back to their nests you can shut t up again. This prevents the cro getting the eggs. With me the q tion of the crows taking eggs young chickens has got to be an a important one, as I have had t take as high as fifty chicks in h lf day, and it is almost impos ible trap or kill them.

It does not require a very hig fence, if made of wire poultry net ting, to confine turkeys. A five-foo fence is sufficient, and a turkey wi not attempt to fly over a fence o this height. With a board fence i is different. The turkeys can see th top of such a fence—something t light on—and will try to fly over. A turkey looks out of its eyes very

L. M. CLARK

ain Street, Petaluma, California

differently from any other bird or animal. If they see a crow or hawk, they turn their heads sideways and look up out of the corners of their eyes. They are a very shy bird, quick to notice danger signals. When a turkey hen scents danger she utters a short, quick note of warning and the poults flatten themselves on the ground or hide in the grass or under a bush until the danger is past. The mother hens will fight to the death in protecting her young.

Many people, when writing for turkeys, ask if there is any white or gray barring in main tail feathers at the base. Now there is a reason for everything, and as the wing of a turkey is an important factor when it comes to high scores, and to have a good wing you must have the white bars as near the same width of the dark bars as possible, and to do this you must run the white barring to the extreme limit, but not overstep it, as too much white or an extra fine barred wing will cause white or gray barring at the base of the main tail feathers, people often demand such a good wing that they are bound to get this barring in tail feathers, not knowing the cause. It can be remedied with another year's mating by using a bird with a little darker wing.

The same principle applies to the breeding of Buff Cochins. It takes a certain amount of black and white blood to get the right shade of buff, without white or black in wing or tail. I started with the best Buffs I could get, but they all had more or less white or black in wings or tail. By careful breeding I succeedded in getting a pullet with no white or black whatever in her plumage, and after several years I eliminated white and black entirely from my flock, and produced birds with a buff quill.

If not already attended to, the breeding turkeys should be mated up at once for the season's work. Birds for the breeding pens should have been secured long before this time. I have had calls for turkeys to be used as breeders after the first litter of eggs had been laid, and as moving the birds after this time retards their laying, your work for the season is badly handicapped.

When introducing strange turkeys into your flock it is a good idea to put the stranger into a yard by himself for three or four days where the other turkeys can see him through the fence. At the end of this time, turn the strange turkey out at night, after the other turkeys have gone to roost. He will go to roost with the others, and while they may have a little "spat," when morning comes they have forgotten that they are stangers and you will have no further trouble.

I have before now killed turkeys and found their crops almost filled with grass and bugs and only a very few kernels of corn, although there was plenty of corn where the turkeys could help themselves at will. This shows that they prefer grass to corn, and even during the winter months, when the ground is not covered with snow, they will feed largely on grass and will need very little other feed. I prefer wheat and shorts to corn as spring feed for turkeys. It is not fattening.—Commercial Poultry.

The slipshod worker regards his occupation a drudgery; what he wants is a brand new attitude.

Feed the Chicks and Kill the Gophers

West Coast Chick Feed

A full, rightly balanced ration for the little ones, to be fed dry. All pure feed, no filler, no waste. The biggest seller because the best made. Keeps them growing and healthy. For sale by many dealers; if not by yours send direct to us.

Bille's Gopher Poison

is most attractive to gophers, squirrels, etc., but sure death. Endorsed by Agricultural Colleges and Experiment Stations. Has had the greatest success for years in the Middle West, and also here in California last season. Circular with many testimonials and Affidavit of 201 killed in one day. If your dealer hasn't it, send $2.50 for two bottles, (not less than two) express prepaid by us. Money refunded if not as represented—so printed on the bottle.

Early Chicks Pay Best

Take advantage of the first suitable weather conditions in early spring and "set" as many broody hens as possible. You may have plump, tender-meated chicks, from one and a half to two pounds weight, in ten weeks' time after hatching if you give them proper feed and attention. Any of the foods commonly given is all right and your success will be ample, provided you escape a large per cent. of loss from the very common diseases which trouble young chickens.

Most chicken ailments come from dampness or overfeeding. Keep the quarters dry and give a little of

DR. HESS
Poultry PAN-A-CE-A

once a day in one of the feeds, and you will save nearly every chick. Where Poultry Pan-a-ce-a shows its great worth is as a tonic to correct the first tendency toward indigestion. Its use gives the organs a proper "tone" and maintains them in perfect health so that the growing chick is steadily deriving from its food every element required to hasten growth.

Poultry Pan-a-ce-a (the prescription of Dr. Hess, M.D., D.V.S.) contains iron to enrich the blood and nitrates to cleanse the system of organic poisons. It makes hens lay, shortens the fattening period for market fowls, and, by its germicidal properties, wards off disease. Endorsed by leading poultrymen in both the United States and Canada. A penny's worth is enough for 30 hens one day.

SOLD EVERYWHERE ON A WRITTEN GUARANTEE.

Starbuck's Barred Plymouth Rocks

We trap nest our hens. Why set from poor layers? Bird laying qualities are inherited the same as any other. This year we have discarded all old matings and have gone to the next generation. Cocks have 9 generations of 200 egg mothers. Hens all from 200 egg mothers and from cock with 6 generations of 200 egg mothers, and are layingfine. We have divided into pens according to the way they are showing up in six months laying. $2.50 for 13 eggs from first pen. $1.00 from 2nd. until they have time to make longer records. (Except from our one best, not for sale. We claim the world's Barred Rock, 6 months laying record for this one.) Do you wish to hear about our prize winning Buff Orpingtons and Silver Wyandottes? We have something to crow about. No Sunday sales or visitors.

Wm Starbuck & Son, Fullerton

possible, selecting hens that conform in all sections as much as you can, and mate them with a male especially strong in their weak points, thus building up future generations. The care one type of fowls would succeed on would be a waste of money and labor on another type, hence the necessity of the birds in each pen being uniform in size and type.

This is one reason why so many who are careless in selecting their flocks make a failure of the poultry business. There are other reasons, but this is one, and when you make up your pens this winter, bear it in mind.—New England Poultry Journal.

MARKING CHICKS.

I have a way of marking my chicks that I never saw mentioned in any poultry paper; that is, as soon as they are a day or two old, I cut off a toe just far enough back to be sure to get all the nail off. It does not bleed but little, but if you cut much further back it may bleed considerable, which I want to avoid. With good shears it is done instantly, and they do not seem to mind it. A different toe each year.—Poultry Advocate.

SIZE OF A HEN'S EGG.

Has the average size of the ordinary hen's egg ever been mathematically computed? Yes. Great egg packers employ men who from dawn to dark do nothing but pass eggs, one after another, before a candle to insure only fresh ones being received. Measurements have been conducted by these and experiments based on perhaps a thousand eggs show the average length of a hen's egg to be 2.27 inches and the average diameter at the broad end 1.72 inches, while the average weight is about one-eighth of a pound.—Montreal Star.

LOCO WEED.

From a circular issued by the Department of Agriculture on results of loco weed investigations we quote:

The word "loco," from the Spanish, meaning crazy, has been applied for a great many years to a disease of stock and sheep in the semi-arid region of the West. There has been a general belief among stockmen that the disease is caused by certain weeds known as loco weeds. The name loco weed has been applied to a large number of plants, but two are considered especially obnoxious—Aragallus lamberti and Astragalus mollissimus.

More or less desultory investigations by scientific men have been made on this subject, the general result of which has been to imply that the disease was produced by some other cause than the loco plants. Later investigations have made it seem quite probable that the cause of the disease must be sought in some other direction. The investigations here recorded were undertaken to clear up first of all the doubt concerning the source of trouble.

The first essential point was to demonstrate whether the loco weeds did or did not cause the disease. The work of the first season, the summer of 1905, accomplished this demonstration in a very satisfactory way. It was clearly proved that Aragallus lamberti would poison horses, sheep and cattle and that Astralagus mollissimus would poison horses. Astralagus mollissimus does not poison cattle because they very rarely eat it.

The work of the second season, the summer of 1906, was mainly devoted to a diagnosis of the disease. The external symptoms described by stockmen were in general corroborated. The principal symptoms are the lowered head, rough coat, slow, staggering gait, movements showing lack of muscular co-ordination, sometimes more or less paralytic symptoms, a generally diseased nervous system, and in the later stages of the disease extreme emaciation.

The principal pathological changes are pronounced anemia of the whole system, diseased stomach walls, and in acute cases a congested condition of the walls of the stomach, while in chronic cases there are frequent ulcers. Generally speaking, locoed cattle have ulcers in the fourth stomach. There is an excess of fluids in the various cavities of the body. This is especially noticeable in the epidural space of the spinal canal. Here the effusion is more or less organized, presenting the appearance of a gelatinous mass, which is especially abundant in the lumber region and about the exits of the spinal nerves. In most locoed females the ovaries are found in a diseased condition.

BLACK MINORCA.

The third stage of the work was the devising of remedial measures. This was undertaken in the summer of 1907. This work naturally had two phases, (1) attempts to eradicate the weed and (2) attempts to cure the locoed animals.

In regard to the possibility of killing the weeds, it was found that this could readily be done in the case of fenced pastures. This is especially feasible with Astragalus mollissimus, because it occurs in comparatively small patches. Aragallus lamberti has a wider distribution, but it is not at all impossible to destroy this weed when in pastures. There seems to be no way of ridding the ranges of these weeds, however.

In regard to the second phase of remedial work, it was found that locoed cattle can in most cases be cured by a course of treatment w
nine, while locoed horses ca
ly be cured by a course of
with Fowler's solution. Th
under treatment must not

A State Poultry Keepers' Organization

E recently mailed a circular etter to the secretaries of all poultry associations that we rmed of, requesting that they elegates to meet at some cennt for the purpose of forming organization but met with ttle response. We consider atter of too much importance poultrymen of our State to be to drop without further disand we hope that this subl be taken up by the poultry nd discussed.

artificial manipulation of the s by the Produce Exchange ring without regard to the supply and demand and the ent rally in prices after the of the Sonoma County Core Association should set poulto thinking, as I am confident e action of that association in the bull by the horns is all ved the market from a much decline during the storage We have the power, if rightied, to see that the laws of and demand are not set at by an organization of San co middlemen.

ry raising in California, as a s, is rapidly growing and is suming front rank among the industries of the State. It is ger an experiment but a profndustry, engaged in which are nd women who give the busine same careful attention as e orchardist, the merchant, or nker to his. Besides push and brains are being put into the business with the result that it is no longer combined in a haphazard way but with a close attention to detail that has made for success.

From an interchange of ideas and experiences many valuable and profitable poultry lessons have been learned. This has lead to local and county organizations which have been conducive of much good. Frequently these associations have been forced to grapple with the important financial end of the industry in the regulation of prices charged for feed, freight tariffs, and kindred equally important matters.:

Through the power of co-operation —the members acting as a unit— large savings have been effected in the purchase of supplies, the reduction of freight charges and fairer dealing by the middlemen, with whom, under existing conditions, we all have to reckon. We have such an Association here in Hollister which has been both profitable and instructive to its members. What has been accomplished locally has led to the idea of a State association for the discussion of matters in which poultry keepers have a mutual interest and for the advancement of the industry along such lines as may be deemed advisable. Cattlemen, orchardists and kindred interests have such organizations which have not only proved beneficial but profitable, for State aid has been secured, through co-operation, whereby pests and diseases, if not wholly eradicated, have been brought under control. What others have done, why cannot poultry keepers do?

A State organization can be effected by the election of delegates for the various local organizations to meet at some central point at a time to be mutually agreed upon. To that end the associations are requested to take such action as will express their views, advising the undersigned who, in behalf of our association, volunteers to act as secretary until such time as the organization is effected or the idea abandoned.—F. L. Jones, secretary Hollister Poultry Keepers' Assn.

CHOOSING THE FLOCK.

In writing this article I assume that the beginner has already decided on a place in which to keep his fowls, and after all, it's not the style of building so long as it is dry and comfortable, that makes success, for there are flocks in all sorts of houses and coops that pay their owners large interest on the work and money expended.

My ideas of a house might not suit others, and theirs might not meet with my approval, so let each one suit his own fancy in this respect. Neither am I going to try in this article to tell which breed is best; that also depends to a great extent on the person; but rather how to pick out the birds you should keep, from whatever you may have, whether pure-bred or mongrels. Don't think I mean to claim that all breeds can be mated for best results according to the same rules in everything. But there are general principles that apply to all stocks.

Many flocks of hens are composed of several different types of birds, yet they are all mixed in together or else sorted according to color. Here is a beginning of failure, for different types require different care.

If yours are pure-bred fowls, then their breed has a distinct type, and only those individuals that correspond to that type are profitable ones to keep, for those that diverge from this are more or less abnormal, and if the divergence is very great, should never be used, even though of themselves they may appear nearly perfect. Perhaps I might say the type is abnormal, and not the individual, as when one of the American class partakes of the Mediterranean form. Such specimens may appear all right, but if you select such to keep, you are opening a door to failure, as such birds will not, as a general rule, do nearly as well as one of the true type will.

Many persons have the idea that a hen with a long, slim body, small head and fairly large comb will make the best layer, but they are mistaken unless the breed calls for such a type. If such birds are selected from the American class a great mistake would be made and almost certain failure result, yet some do it, make a failure and condemn the breed, or all breeds, as not worth keeping; while if the Americans are selected as they should be they will hold their own with any breed, and make money for the owner. It is the same with all breeds, select for type first, and the nearer your birds come to standard requirements the more profitable your flock will be.

If yours are mongrels select only birds having the same type and those having a symmetrical form. Some hens are decidedly masculine in appearance; let all such go as worthless, and throw out all having any deformity. Now make up your pens of as near uniform specimens as

Poultry Raising on the Cudahy Ranch

Poultry raising on the Cudahy Ranch is a demonstrated success. The soil is ideal—light and free from "hardpan"—ensuring healthy, well matured birds—and a maximum egg production. Feed is cheap—and most of it can be raised on the ranch. Markets for eggs and poultry are but twenty minutes away—on the Whittier Electric Line, the Southern Pacific and Salt Lake Railroads.

Cudahy Ranch Lands range from $350 to $500 per acre; terms, 1-4 cash, balance long time.

Free water in abundance—deeded with the property.

You can buy one acre or as much as you want—every bit of the great 2800-acre Cudahy Ranch is superb poultry land.

Mr. W. W. Howard, one of the foremost White Leghorn authorities in America, thinks so highly of the Cudahy Ranch for Poultry Farming that he has established his model farm there.

No matter whether you are expert or novice, you'll do well to follow Mr. Howard, a man who has made a splendid success of poultry raising.

Call or write for facts or, better still, go down to the ranch and study the proposition at first hand. Whittier cars leave on the even hour from the P. E. Building at 6th & Main streets, Los Angeles.

VARIOUS HAYSEEDS.

WHEAT, oats, barley and alfalfa are the hay producers in common use. The usual fault in sowing is light seeding, 100 pounds and upward of the cereals is not too much. Upward is more profitable than less than this amount. I speak of this because it is a struggle to get enough seed on the land. The men seem to think it a pity to cover up with earth good foodstuff like seed. Experience should teach the importance of this seeding, for whenever the crop proves not worth harvesting and the grain is left to volunteer, the volunteer crop is always heavy, often double the usual crop. Any one who has disked down a crop of grain as not worth cutting for hay has been surprised at the immense crop of hay the next year. The seeding was heavy was the explanation, not the usual one given of that "volunteer crops are always best if one could always have them.

Germination.

The commercial seeds should always be tested before sowing extensively. Asimple way is to put the seed between layers of blotting paper, soaking the paper in warm water and putting it on a plate in a warm place. The seeds will sprout quickly. Count those that failed to grow and then those that have grown to find out the money value of the seeds. Often the highest-priced seed will be the cheaper in the end. This year I had samples of alfalfa seed sent to me that less than 10 per cent. would sprout. There were plenty of other seeds mixed in that did sprout more readily. A sample of seed barley, 95 per cent. grew readily, while another sample of barley less than 60 per cent. half germinated in a two weeks' test. The first sample was worth double that of the second for the reason the first would have all grown while the second was so slow that had any dryness or other troubles come, a larger per cent. would have been caught by the vicissitudes.

Alfalfa Seed.

This season the alfalfa seed has been unusually good. The vitality has been high. The constant demand for clean seed is bringing results. Dodder seed has not been as plentiful. I found it in three samples only out of ten, and in only one was it marked in quantity. One sample was curious in that it seemed to be a familiar seed, but not alfalfa. I could not locate it until it began to grow, when I recognized the old and valuable nitrogen-producer burr clover. This, however, was certainly an error of some one in mixing the two seeds, as the burr clover was nearly half the seed. Cleaned burr clover seed is too valuable to be used to cheapen alfalfa seed. The purity of the alfalfa seed can be readily determined by testing it. Pour out a teaspoonful on a sheet of white paper—spreading it around loosely for examination. By carefully looking at an alfalfa seed it will be found to be slightly curved, longer than it is broad, rather thick, of an olive green color. On one side is plainly visible the tiny moon-shaped scar where it was joined in the pod. This same scar can be studied on the side of the beans in the next dish of baked beans you try to think real good eating!

Dodder seed is the greatest to be feared of all the pest of the alfalfa field, yet the seeds can be r screened out before sowing. T der seed is a dull yellow seed ly transparent or perhaps tran would better describe it. The oval and flat, not noticeably th the alfalfa seed; it is also wi side scar, or moon, so noti the side of the alfalfa seed. C seeds off into groups until a have been counted, then see ho of these are alfalfa seed, and t centage is easily arrived at. of white paper and a darning is all that is necessary to count out the seeds. The germ test is the same for all seeds.

M. E. SHER

FEEDING BEET PULP TO ST

In Bulletin No. 101 issued Utah station, we note the fo conclusion regarding the adv of feeding beet pulp and mola stock:

The principal question stu the value of sugar beet pulp fo animals, though tests of the a apples for pigs and of gains different breeds are also repo

In a test of the value of and alfalfa with and wit made with five lots of fi each the great gain per h day in a 70-day period, 2.06 was made by a lot fed a daily of alfalfa and beet pulp ad with four pounds of grain, a smallest gain, 1,37 pounds, lot fed alfalfa and beet pulp tum without grain. The gain most expensive, costing 7.31 per pound on alfalfa and bee ad libitum, and was least exp costing 3.83 cents on alfalfa tum and one-half as much p

In a similar test made lots of 15 sheep each th ranged from 0.2 pound per day with the lots receivin tively, alfalfa and beet pulp tum with and without 0.5 grain per head per day to 0. per head per day with the ceiving alfalfa and beet pulp a tum with one pound of grain was most expensive with th mentioned lot, costing 5.15 cent was cheapest 3.18 cents, with th fed alfalfa and a half ration o pulp.

When sugar beets were add alfalfa and grain a lot of four made an average daily gain of pounds per head in a test cov 100 days, while five steers fed a ilar ration without sugar gained 1.13 pounds. The cost pound of gain in the two cases 9.6 and 7.3 cents respectively

When similar rations were with sheep the average daily with beets was 0.35 pounds per and without beets 0.22 pounds, period covering 137 days. Th of a pound of gain in the two was 6.9 and 5.7 cents, respecti

To secure data regarding t e fects of beet pulp on the stren h bone a lot of three wethers was f 10 pounds of pulp per head per da while a similar lot received no pul The strength of a number of t more important bones was dete mined with a testing machine and every case it was found that the was a difference in favor of the pu ration.

Beet pulp as part of a ration wa studied with two pairs of wor horses for two periods of 28 day

ation is no better than the in-
l homes it represents; there-
e home builder is the highest
civilization."

each, one horse in each team receiving pulp and the rations being reversed during the second period. An average loss of six pounds per head was noted on the pulp ration and of two pounds on the ration without pulp. "As high as 20 pounds of pulp was fed to horses per animal per day without any apparent injury. In a ration of alfalfa hay and oats nine pounds of well-fermented solid pulp saved 1.5 pounds oats. The horses took to the pulp reluctantly and their appetite for it gradually decreased." Colts have been allowed constant access to pulp, according to the author, for several years and in no instance has trouble arisen from it so far as is known.

In tests of the value of sugar beet products for pigs, it was found that five pigs, fed green alfalfa, skim milk and shorts with molasses, made an average daily gain of 1.03 pounds per head in a 58-day feeding period as compared with 0.85 pounds per head per day with a lot of four pigs fed a similar ration without molasses. The cost of a pound of gain in the two cases was 2.43 and 2.92 cents, respectively.

In a second test shorts with and without beet pulp, with sugar beets, and with pulp and molasses were compared in a period covering 48 days. The gains ranged from 1.2 pounds per head per day on both the shorts and beet pulp and the shorts and sugar-beet rations to 1.73 pounds on shorts alone, and the cost from 2.21 cents on shorts, pulp and molasses to 3.71 cents on shorts and sugar beets.

When shorts and skim milk with and without beet pulp or sugar beets were studied the smallest gain, 1.07 pounds per pig per day, was made by the lot fed the skim milk and beet pulp ration, and the greatest gain, 1.36 pounds, by the lot fed shorts and skim milk only. The gain was least expensive, costing 3.38 cents per pound on shorts, skim milk and beet pulp, and most expensive, costing 3.93 cents per pound on shorts, skim milk and sugar beets.

When apples as part of a ration were fed to pigs receiving shorts and skim milk the average daily gain per head in two tests with apples was 1.6 pounds and without apples 1.4 pounds. The calculated value of the apples, according to the author, ranged from nothing to 18 cents per 100 pounds.

When apples and shorts were fed in comparison with pasturage and shorts to two lots of three pigs each, they were found to have a feeding value about equal to grass, the average daily gain being 0.59 pounds per pig on the apple ration and 0.56 pounds on pasturage.

HOW TO FEED.

Our present knowledge of feeding can be boiled down into the following maxims:

The more food the cow can be induced to eat, the more milk she will produce. Cows do not usually consume more food than they can properly digest. The ration, therefore, should be made as palatable as possible in order to induce the cow to eat large quantities.

The larger the amount of protein in the ration, the larger the milk flow. Protein in the ration is essential to the production of the milk.

The less energy required to digest the ration, the larger the milk flow.

The richer the ration, the richer the

DE LAVAL
CREAM
SEPARATORS
ALWAYS IN THE LEAD

From the invention by DE LAVAL of the first practical cream separator in 1878 the DE LAVAL machines have always been in the lead.

The first "hollow bowl" cream separator; the first factory cream separator; all of the several first styles of hand separators; the first steam turbine separator; the first "disc" bowl separator and the first "split-wing" or distributing tubular shaft separator—were each and all DE LAVAL inventions, each marking periods of advancing evolution in the usefulness of the cream separator.

So too were the first "tubular" shaped bowl separator; the first bottom feed separator; the first vertical "blade" bowl separator; the first interior cone construction bowl separator, and numberless other types of construction, each and all DE LAVAL inventions, though found so impractical or comparatively inferior, from one reason or another, that they were never put into commercial use in the DE LAVAL machines.

Every would-be competing cream separator on the market today merely utilizes some patent expired or abandoned DE LAVAL construction, and if any one of them should make pretense of denying it the patent evidence may be easily produced showing the falsity or evasion of such denial.

The new 1908 DE LAVAL cream separators mark another great evolution in cream separator construction, being new and remodeled in practically every detail, and place a still wider margin of superiority between the DE LAVAL and even the best of imitating separators.

The DE LAVAL main factories in the United States and Sweden are the largest and finest of their kind and have ranked for ten years among the model shops of the world; their equipment is the best that mechanical science and money can make it; the twenty smaller DE LAVAL factories, assembling and repair shops, in as many different countries, are relatively as superior; the DE LAVAL inventors and experimental engineers are the best of the men who have shown practical separator genius in every country, and a large staff of them is kept constantly at the betterment of the DE LAVAL machines, while the shop employees generally are the most competent and best paid in their various classes.

THE GREAT OBJECT EVER KEPT BEFORE EVERY MEMBER OF THE DE LAVAL PRODUCTIVE ORGANIZATION IS THE MAKING OF THE BEST CREAM SEPARATOR POSSIBLE AND EVER THE MAKING OF IT BETTER THIS YEAR THAN LAST YEAR.

These are the reasons why the DE LAVAL machines began in the lead and have kept it from 1878 to 1908, excelling all attempted imitation and competition in even greater degree today than at any past time.

The new 1908 DE LAVAL catalogue—affording an education in separator knowledge—is to be had for the asking.

Always Proud of It
Always Glad to Tell It
Want Others to Know It

That's the truth about a man or woman who buys a **Tubular Cream Separator.** When people have the best there is they don't hesitate to say what they have, and you'll always find that when asked how he runs his dairy every Tubular owner says: "Why I have a TUBULAR Separator." He doesn't simply say: "I use a separator." Oh no! He knows the Tubular is the best and he wants you to know he had the good sense to buy the best. It's a pardonable pride. We all have it. Why shouldn't we?

The Tubular

Built Better
Runs Better
Looks Better
Skims Better
Wears Better
Is Better
than any other cream separator. Ask the man who ownsone.

We have been building cream separators for twenty-eight years right on the same spot; we know more about building cream separators than anyone else in the business, and we know the TUBULAR is the best that ever was built. Why shouldn't we be proud of it? Why shouldn't the farmer who owns one be proud of it? It's like a diamond ring; there's nothing better.

How about the fellow who has a "mail order," "catalog house" separator, or one of the back number "bucket bowl" machines so loudly advertised in the papers? What does he say about his cream separator? Does he speak up promptly and give the name of it? Not much; he just says: "I have a separator." He doesn't like to tell the name of it. He does not talk about it when he can avoid it. Twice a day when he tries to run it he says things about it that wouldn't look well in print, but he isn't anxious for his neighbors to know how badly he was soaked. **He** isn't proud. No indeed, he knows there isn't much for him to say.

Which Will You Be
One of the proud, sensible ones or one of the other kind?

You have a chance to be either but you can't afford to be in the second class. You cannot make a mistake in buying a TUBULAR. It's built and guaranteed by the largest cream separator factory in the world and the oldest in America. Wouldn't you like our new catalog No. 260? Write for it please.

manure. The dairy farmer must look here for a large part of his profit.

No two cows can be fed alike. Each must be studied differently. Increase the protein in the ration and watch the milk flow.

Change the hog pasture very often. In the first place if fed too long in one pasture the grass will be entirely killed out. It is best to build a small shelter on skids which can be moved from one place to another.

Many a man is penny wise and pound foolish when it comes to purchasing a milch cow. It doesn't pay to buy a cow just because she is cheap and imagine you've got a bargain. The loss you'll find in the milk pail.

The bull at best is a treacherous beast. Always keep your eye on him and be careful not to turn your back, unless he is tied.

The farmer who thinks more of his own welfare than he does of that of his live stock, is often disappointed on market day.

The milk of every cow should be weighed and a record kept, and the milk should be tested by the Babcock test twice a month. You will never know the true value of each cow in your herd until this is done. To do .. will require a little time, but it will prove the most profitable time you devote to your whole business.

CHANGE IN TEXAS FEVER
ANTINE REGULATION

New regulations regarding fever of cattle have been issu the Secretary of Agriculture t effect April 1. They are desi as Bureau of Animal Industry 151 and Amendment 3 to Ordc and copies will be furnished to ested persons on application Bureau at Washington, D. C.

These regulations describe th quarantined on account of fever, and prescribe the conditio der which the movement of from that area is permitted. general rule, between Februar October 31, cattle may be mov the quarantined area only shipped by rail to market cen immediate slaughter. Specia sion is made, however, for th ment of cattle for other purpos certain districts where some farms and pastures have been t ticks, when the cattle are and certified to be free fro These districts are hereafter r to in this article as "provi quarantined."

The principal changes m Amendment 3 to Order 143 c amplifying the specifications construction and mainten yards and approaches for sive use of cattle from th tined area in the course of tr tion through non-quarantin tory, and in prescribing simila fications for noninfectious pen quarantined area.

Order 151 changes the qu line in several particulars. the changes are the result of done during the past year by reau of Animal Industry in tion with State authorities eradicating the cattle tick, is, consequentlly, a conside duction in the quarantined quarantine now includes States of Louisana, Missi bama, Florida, South Car parts of California, Texas, Ok Missouri, Arkansas, Tenness gia, North Carolina and Virg

The actual changes in the tined area compared with la are as follows in California:

The remainder of Madera (that part lying west of the of the Southern Pacific Railw released from provisional qua and the counties of Ventur Riverside are admitted to prov quarantine. This leaves o counties of Orange, San Diego a perial as the area that is who antined.

The new regulations recog the correct scientific name of tle ticks "Margaropus annula stead of "Boophilus annulatu heretofore used. This change because scientists are agreed der the Zoological law of pri former name takes precede the latter.

Grain growers in El Dorado ty have met serious loss in grain for seed, which did not nate. It is asserted that th ment to destroy the weevil the destruction of the germ.

Oranges have been delivere Eastern markets this year much promptly than for several years S cars have been landed in New this year in twelve days instead twenty as was formerly the ca

GRASSHOPPERS IN ALFALFA.

The alfalfa fields suffer to a greater or less extent every year from the ravages of grasshoppers. Of the several hundred kinds known to the specialist, two appear to be the most frequent cause of complaint. They are among the largest species that we have and are known as the differential and two-line grasshoppers. The former is greenish yellow in color and the latter is marked by two pale lines running down the sides the entire length of the body.

The eggs of both kinds are laid in late summer or fall in pods in the ground. Thirty or forty eggs are placed in each pod. The pods are placed an inch or more under the surface of the ground and are made almost waterproof by being lined and covered with a sticky fluid which hardens into a leathery case. The insects seem to prefer a compact soil which is not too moist. Hence, ditch banks, paths and dry knolls are most often selected.

In the spring when the alfalfa begins to grow, the eggs hatch and the young hoppers find an abundant supply of fresh, succulent food which is just what they need for their success in the world.

At this season the injury is not much noticed because the "hoppers" are so small that the quantity eaten is not very great. Later in the summer when they attain considerable size, the case is different.

The best remedies are preventative and can be applied in early spring with benefit to the alfalfa crop.

All ditch banks, fence lines and waste corners should be burned over and cleaned up. If the surface of the ground can be stirred to the depth of two inches great benefit will follow. This measure tends to break up the pods of eggs, exposing the contents to the weather, which is almost certain to be fatal. The eggs will be dried out or soaked with water, in either case preventing their hatching. The birds and other animals will be able to render much better service by eating large numbers of them.

The alfalfa field should be thoroughly disked to the depth of two or three inches. This will accomplish the purposes stated above. In doing this work set the discs nearly vertical so that they will not cut off the crowns of the plants. Prof. Olin of the Colorado Agricultural College is authority for the statement that disking acts like a tonic to alfalfa.

Co-operation among farmers having adjoining fields of alfalfa is very desirable since the "hoppers" are much given to migrating from one field to another.—S. Arthur Johnson, Associate Professor of Entomology, Colorado Agricultural College.

SUCCESS INCUBATORS.

The E. E. McClanahan Company of 711 S. Main street, Los Angeles, has just issued a most attractive catalogue of the Success Incubators. It starts in with a dozen reasons why one is able to "succeed with a Success." Built for Pacific Coast trade and to meet coast conditions. Selfishness does not prevail in the putting together of the book, for we note an article by F. H. Thomas on care of chicks, also one by Mrs. Basley on selecting eggs for incubation. So the booklet is well worth sending for.

If the Cultivator is mentioned the book will be sent for the asking.

Turlock expects great benefits from the co-operative marketing association known as the Central California Produce Company.

Classified Liners

Rates 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

FAIRYLAND.

Do you know of the house
  Where the ginger snaps grow?
Where tarts for the children
  March out in a row?
Where wishing is having?
  Where—isn't it grand?
Just up in the garret
  Is real Fairyland?
Where youngsters can caper
  And romp and hello?
For they always do right,
  Whatever they do.
You don't know the house?
  Then, oh, deary me,
I'm sorry for you!
  Why, it's grandma's, you see.
Don't look for the flaws as you go
    through life,
  And if you happen to find them,
It is wise and kind to be somewhat
    blind,
  And look for virtue behind them.
For the darkest night has a hint of
    light
  Somewhere in its shadow hiding,
And 'tis better far to hunt for a star
  Than the spots on the moon abiding.
—ELLA W. WILCOX.

COMPARING VIEWS.

"WHY," remarked the Bachelor Girl, nodding toward a bored-looking couple, who sat as far apart as possible on the bench opposite, "are they always like that—after marriage?"

"Perhaps," suggested the Mere Man, edging closer to the Bachelor Girl and casually letting his arm slip across the back of the park bench, "it's because they're too much like this before marriage.".

The Bachelor Girl glanced up and started to rise.

"Or perhaps," added the Mere Man, hastily removing his arm, "it's because they're thinking of their troubles and worrying about their bills and——"

"I don't believe it," declared the Bachelor Girl, sitting down again and thoughtfully digging her toe in the autumn leaves at her feet. "It isn't the troubles and worries that separate married people; it's the pleasures"

"What?"

"The pleasures they don't take," explained the Bachelor Girl; "The leisure hours they don't know how to fill in, nor what to do with; the dull Saturday afternoons and long, dreary Sundays; the stupid evenings and mirthless holidays. Haven't you noticed that all the most harrowing domestic scenes and all the marital squabbles that are brought into the divorce court and the police court occur over Sunday?"

"I've noticed it," remarked the Mere Man thoughtfully. "A girl will enjoy following her sweetheart over the golf links until her knees and elbows ache who wouldn't touch a golf stick after she was married to him."

"And I've noticed," retorted the Bachelor Girl, "that a man will find a mad excitement in walking twenty miles a day with a woman with whom he is in love who wouldn't bother to walk around the corner with her if she were his wife. Just because a man will allow a girl to read Browning to him and air her opinions of Ibsen before marriage is no sign that he is going to let her read the morning paper to him and air her opinions on politics afterward: and just because he will spend his time and money taking her to grand opera during their engagement is no reason that he won't drag her to vaudeville shows and extravaganzas after the wedding. In the love stage any two people can fancy they have tastes in common; but, as a matter of fact, men and women haven't any ta common whatever. When they congenial it's merely a matter having subdued the other an made him or her go his way.

The Mere Man took off his h gazed at the Bachelor Girl in c nation.

"Do you mean to say," he ex "that if I married you, you w enjoy walking in the park wi

The Bachelor Girl gazed dr off through the trees.

"And that you are just prete to like rarebits and the smell pipe?"

The Bachelor Girl looked d her toes.

"And that you are really bo death when we are discussing the sex problem, and that you ly hate bohemian tables d'h the Rubaiyat and the way I p hair, and that this minute y actually annoyed——"

"Oh, not this minute," broke Bachelor Girl. "I'm not marr you—this minute."

"Humph!" grunted the Me "And yet we marry for co ship! We marry because we some——"

"And are always ten t lonesome afterward," fini Bachelor Girl with a sigh. " ry because we want to live and immediately proceed to our lives."

"But," objected the Mere Ma fully, "don't two married peo work together?"

"Of course they do," reto Bachelor Girl, "but they ne together. As long as two y ple are struggling through pov trouble, they go hand in long as the husband is earn a dollar and the wife to make it go as far as po don't listen for the discord in ding march. But the minut on their feet and have plenty to amuse themselves, they s notice that the marriage bells of tune and discover that th to go in opposite directions. Th develops a taste for poker and liards, and the woman devel longing for bridge whist and s The man finds he has been dr all his life of spending his su fishing in the Adirondacks, wh woman has been dreaming o ing hers at Newport and Bar bor. The man is delighted at prospect of having long, quiet e ings in his library with noth worry or bother him, while the an is planning to give dinner p and go to receptions. And right at the beginning of their pro is the parting of the ways."

"And they never can meet on common ground until they meet burying-ground," put in the Man gloomily.

"Yes," agreed the Bache "even if they do try to be acco dating and to take their amus together, they never get any mu satisfaction out of it. If they go the races, he wants to talk about th horses and she wants to talk abo the hats. If it's a dinner, he wan to discuss the oysters and the win and she wants to discuss the deco tions and the women. Even if it only Coney Island, they will figh about whether to go through the imi tation heaven or the imitation hell."

"And when they try to a th

Bachelor Girl started to rise.

do love to sit on a park bench isten to you talk!" finished the Man.

!" the Bachelor Girl looked a disappointed. "Let's go," she coldly, as she rose and shook out kirts.

hich way?" inquired the Mere standing in front of her.

"Which way do you want to go?" she asked generously.

"Oh, in the opposite direction," answered the Mere Man, absently.

"What?"

"I only wanted to see how it would feel——" he began.

"Don't!" cried the Bachelor Girl, quickly taking his arm and starting down the path. It's so much nicer just to be—to be——"

"Sweethearts?" suggested the Mere Man, trying to peer under her hat.

"Unmarried!" corrected the Bachelor Girl, stooping to pick up an autumn leaf.—New York Press.

RECIPES.

When you fry fish, and the fat gets boiling hot, before you put the fish in, sprinkle a little salt on the bottom of the pan. You may then turn the fish without breaking.

Let the fish remain in cold water, slightly salted, for an hour before cooking; place in dripping pan with a little hot water, and bake in a hot oven; just before it is done butter it well and let it brown; a small fish will bake in half an hour; it will take longer for a larger one.

Pure Baking Powder.

One pound pure cream of tatar, ½ pound baking soda, 1-4 pound cornstarch, 1-4 pound flour. Sift 7 or 8 times.

Ice Cream Candy.

Boil two pounds of granulated sugar, one cup of cold water, with one tablespoon of vinegar, without stirring, till brittle. Pour on buttered tins, and when nearly cold, pull rapidly till white and brittle.

How To Bake Sardines.

This little savory is seasonable at all times, as sardines are with us the year round. To make the dish you must bone as many of the fish as you require, first removing the skin; then make a little white sauce (about a quarter of a pint) and add to it a seasoning of salt, pepper, cayenne and a few drops of lemon juice; now add the sardines and put the mixture into scallop tins; cover each with fine breadcrumbs; put a few small pieces of butter on the top and bake for about ten minutes in a moderate oven.

To Blanch Green Beans.

Green beans should always be blanched. To do this drain them from the cold water and put them into water that is boiling rapidly, allowing a teaspoonful of salt to two quarts of water. Boil rapidly, with the cover partially off the saucepan, for twenty minutes. Turn into a colander and let cold water run upon them. They are now ready to be finished in any manner you like. The blanching can be done in the morning while the fire is good and the beans be finished for dinner at the proper time.

Spinach Cooked Without Water.

Fresh spinach when washed holds enough water for cooking. Put the spinach in a stewpan and on the fire; cover and cook for ten minutes. Press down and turn the spinach over several times during the cooking. At the end of ten minutes turn the spinach into a chopping bowl, and mince rather fine. Return to the stewpan and add the seasonings, allowing for half a peck of spinach two generous tablespoonfuls of butter and a teaspoonful of salt. Simmer ten minutes; or if very tender five minutes will be sufficient.

Spinach cooked in this manner will retain all its salts. It will be more laxative and the flavor stronger than when blanched (boiled in water). In young, tender spinach this is not objectionable, but when the overgrown vegetable is cooked in its own moisture the flavor is strong and somewhat acrid.

Green Beans Boiled With Pork.

Boil about a quarter of a pound of pork for five hours. Have the beans free from strings and cut about two inches long. Cook them with the pork until tender (about half an hour).

Or drain the water from the beans. Put the butter in a saucepan with one tablespoonful of flour. Stir over the fire until smooth and frothy, then add the beans and stir over the fire for five minutes. Draw back and add half a pint of water, meat stock, or milk. Simmer ten minutes. If liked, a teaspoonful of fine herbs may be added a few minutes before serving. It will take from forty-five to sixty minutes to boil the beans sufficiently.

QUIT.

Anticipating evils in the future.

Pretending, and be your real self.

Going round with a gloomy face.

Faulting, nagging and worrying.

Dreaming that you would be happier in some other place or circumstances.

Thinking that all the good chances and opportunities are gone by.

Carping and criticising. See the best rather than the worst in others.

Belittling those whom you envy because you feel that they are superior to yourself.

Dilating on your pains and aches and misfortunes to everyone who will listen to you.

Gazing idly into the future and dreaming about it instead of making the most of the present.

Longing for the good things that others have instead of going to work and earning them for yourself.

Looking for opportunities hundreds or thousands of miles away instead of right where you are.—Success.

Speculating as to what you would do in some one else's place, and do your best in your own.

SIMPLE CURES FOR SIMPLE ILLS.

Take raw egg immediately to drive a fish bone from the throat.

An excellent remedy for boils is one-fifth of a grain of sulphide of calcium pills, three or four times a day.

For constipation, headache or drowsiness take one teaspoonful of pure sulphate of soda in a tumbler of hot water an hour before breakfast every morning.

For a coated tongue, take a five-grain blue pill at night and a teaspoonful of Rochelle salts in half a glass of water before breakfast the next morning.

For red eyelids the following has been found excellent. Vinum opis, one drachm; zinc sulphate, eight grains; rose water, eight ounces. Have it compounded by your druggist and bathe several times daily.—Coleman's Rural.

When a man attributes his success to the taking advantage of an opportunity the opportunity is usually but another name for an easy mark.

Miss Smith—"I see that the legislature has passed a law prohibiting the women from wearing stuffed birds or feathers on their hats."

Eggs and Poultry.

Regarding the egg market and the effect on it by the combination of Sonoma county poultrymen, the Chronicle says: There was a marked scarcity of fresh extra eggs in the local market yesterday, with the result that buyers who were caught short bid keenly for all available lots and the price advanced to 20 cents a dozen, 3 cents better than Saturday's quotation. It is thought on the Exchange here that the Sonoma county poultry interests, who have lately developed considerable influence through pooling of stocks, have combined here to prevent any supplies from reaching local receivers. If this continues the price of eggs will undoubtedly advance even more materially than it did yesterday.

Hay.

Somers & Co. say: Crop conditions in most parts of the State are not at all promising at the moment, for rain is needed in almost every district. In our opinion it is too early to feel any apprehension, for past experience has shown us that wonders can be performed by quite late showers. We believe, therefore, that most districts can go to or three weeks yet without a crop failure. It is earnestly to be hoped that bountiful rains may be noted shortly, for the State's prosperity and incidentally the welfare of San Francisco will depend on the harvesting of the crop now growing.

POSSIBILITIES OF WALNUT CULTURE.

Continued from Page 423.

They need to be given a fair trial before we can fairly judge as to their productiveness. The method, which unfortunately is being used by some disseminators of grafted stock, of going into a seedling orchard and procuring scions from prunings or from a great number of seedling trees, without any or much regard to character of trees, procures only the benefit of perhaps a good root, as the top will vary in nearly every respect as much as seedling trees. The very thing for which one is working is in this way defeated.

Be Careful.

There should be more careful selection of scions from known trees, and especially if the trees be seedlings, should the scions from one tree be kept separate from another, as in no case is one seedling exactly like another. Of course, if one is taking scions from a grafted orchard where the trees are without fail of the same variety, then this does not apply so strongly. Nevertheless, in order to get the best results one hould be exceedingly careful in his selection of his stock and know something of its parentage.

See to Pollination.

Again, in the planting of an orchard it would undoubtedly be a good investment to set out at least two varieties for the sake of better pollination. In most orchards at the present time the staminate calkins come out and have nearly all fallen before the pistillate blossoms are out. If in the orchard there were planted a second variety where calkins would come out later, there would be a greater chance for pistillate blossoms to become pollinated.

There is but little doubt that there is a great reduction in the crop by non-pollination and the inter-planting of a second variety coming out later would increase the yield considerably.

The problem, however, which today concerns the walnut grower who has a seedling orchard is that of how to increase its productiveness, by either cultural methods or by top grafting or both. There arises then immediately the question of whether it is profitable and practical to graft over large trees and thereby increase production. Can an old seedling orchard be successfully top-grafted or not, and if so, why cannot each tree be made to bear one hundred pounds or more of walnuts. This phase of the problem involves the practicability of top working these old seedling trees to immune or resistant varieties. As the stock will in no wise influence the blight resistancy of the top that is put on it, the question then becomes one of degree of success in grafting or budding old trees.

Gradually Work Them Over.

Every walnut grower has in his orchard one or more trees that have been continuously good bearers, and trees of such desirability that he would be satisfied to have a whole orchard of that kind of trees. If he could successfully work over his poorer trees from year to year and still not lose much from decreased production, as he would take the non-paying trees first, the grafted ones would be coming into good bearing again in three or four years. In that way a man could gradually work his old trees and soon have a uniformly good producing orchard.

* * *

Methods of grafting are then treated by Prof. Ramsey and will later be given in the Cultivator.

SAYINGS OF JOSH BILLINGS.

To find the square root of a hog's nose, turn him into a garden patch.

To get wrong things out of a child's head—comb it often.

He who by farmin' would get rich,
Must plow, and sow, and dig, and sich,
Work hard all day, sleep hard at night,
Save every cent, and not get tight.

About the meanest critter there is now traveling around on the bosom of the earth is a bashful hypocrite.

There is only one good substitute for the endearments of a sister, and that is the endearments of some other fellow's sister.

The less a man knows, the more he will guess at, and guessing is nothing more than suspicion.

When I get thoroughly rich, the first thing I intend to do is to become respectable.

It is a statistical fact that the wicked work harder to reach hell than the righteous do to get to heaven.

To make a hoe cake, take a hoe and boil it into a thin jell, and then—let her cake.

If you want to get a sure crop and a big yield, sow wild oats.

Men mourn for what they have lost, women for what they haven't got.

Love is like the measles, we can't have it bad but once, and the later in life we have it, the tougher it goes with us.

There is nothing in this world that a man pays so high a price for, and gets so little of his money back, as he does for repentance.

NATURAL ABILITY.

At a party recently they were playing a game which consisted in everybody in the room making a face, and the one who made the worst face was awarded a prize. They all did their level best, and then a gentleman went up to one of the ladies and said:

"Well, madam, I think you have won the prize."

"Oh," she said, "I wasn't playing.

The Temples of the West

TEMPLES of the East arise upon her ancient shores,
hunger, gaunt and haggard, lies beside their open doors.
bells of even call to prayer when torrid day is done,
upers pray for regions where death comes not with the sun.

nples of the Eastland gleam with gilded peak and spire
ne polished structures seem great monuments of fire.
y who madly stretch to Buddha their supplicating hands
naked footprints, done in blood, imprinted on the sands.

tisans have builded well the temples of the East
ign, design and capital their mystery increased.
ching doorways are engraved with names of gods divine,
et the god-forgotten slaved to rear the godly shrine.

mples of the West look down upon the azure seas;
and weary famine town looks sadly up to these.
led dome reflects the sun on eyes with sunlight blind,
ks from sight, when day is done, while death steals up behind.

mples of the Westland gleam as gleam the Eastern spires
ar the colors of a dream, the sunset's tender fires.
lt upon their shining towers is like the rainbow's glow;
nges with the changing hours, while sunsets come and go.

And never in the Orient such pillars rise as these;
Such beauties never there are blent in wall and roof and frieze—
For never by the ancient shore where gilt pagodas rise
Upon emblazoned temples pour such lights of paradise.

The temples of the Westland lift their pillars to the sky
While ships of vapor slowly drift in stately splendor by.
The temples of the Westland rise from out the Westland soil,
Reared not by skill of weeping eyes or hopeless hands of toil.

O, temples of the East, your gods much tribute have required—
The birth and life and death of clods, to rear you many-spired.
The temples of the West were made by neither toil nor pelf—
The God who dwells within their shade has builded them Himself.

Ring out, you bells of temples East; you call me less than these
That spread their sweet communion feast beneath the Westward trees.
Ring forth upon the sultry air when dying day is dim;
I hear another call to prayer—the forest's mighty hymn.

I stand before an open door, a temple in the West,
I hear the music on the shore of waves that sink to rest.
Above me mount the Westland firs; their incense rises pure.
O gilded Eastward sepulchers, my soul you cannot lure.

ind Mill.

shallow rooting crops very much irrigation
e by means of wells and windmills. This
is especially noticeable in the strawberry section around Florin, in Sacramento county, where a perfect forest of windmills may be seen at work during the fruiting season. In this case the soil water is near the surface, the lift is not heavy and the wind furnishes ample power for the work.

Use the Power.

Very many of our farmers and fruit growers who can find water at shallow depths on their land have installed electric, steam or gasoline plants. One of the most perfect of these is owned by Russ D. Stephens, who has a large fruit ranch in the American river. He has a powerful dynamo driven by electricity from Folsome and is enabled by its aid to flood his entire tract in a short time.

Courtesy Gridley Herald.

A LARGE ORANGE GROVE NEAR GRIDLEY, SACRAMENTO VALLEY.

In San Joaquin.

As we travel south irrigation becomes more prominent and important and in San Joaquin county there are several extensive systems. San Joaquin is one of the best watered counties in the State, having three rivers of considerable size which intersect the county, the San Joaquin from the south to north, and the Mokelumne and the Calaveras from east to west. San Joaquin is the one county of the State in which nearly every acre of its territory is practically arable and most of it is under some system of irrigation except such as is naturally damp, and there is much of this class.

Opposition to Irrigation.

The counties of the Sacramento valley have been slow in ranging themselves in the irrigated class and many of the greater enterprises intended to develop the country have met with opposition, but with the influx of population and the consequent increased price of land, the necessity of the artificial application of water is impressing itself upon the people. For very many years after the settlement of this State the land of the Sacramento valley was valued only for its production of cereal crops. But these, by continuous cropping, became each year less and less profitable until wheat growing ceased to pay. So long as there was money in wheat, however, the great wheat farmers stood out strongly against settlement and the subdivision of the land. This, of course, meant opposition to irrigation enterprises also. But as wheat growing has ceased to pay a change has come over that section and irrigation and small farms are now the rule and are growing in popularity. With population comes increased irrigation with the conservation of the mountain waters, and it is only a question of a few years before the whole of the Sacramento valley, or at least all that is susceptible to cultivation, will be under irrigation.

Give us a Balanced Ration.

Already surveys have been made of the principal watersheds and reservoir sites located, looking to the conservation of the winter rainfall for summer use, and the possibilities in this direction are unlimited. In the mountains along all the tributaries of our great river there are num-

Deciduous Fruit Cult

IRRIGATION OF DECIDUOUS TREES.

IN THE rainy sections of California, irrigation of deciduous fruits was long looked upon as not only useless but injurious. It was thought that it could not be practiced without producing a watery and tasteless article that would not hold up in shipping and would be inferior for canning or drying purposes. This idea is fast giving away to a more sensible way of considering the subject. When the trees are situated on naturally moist land, irrigation is in most cases of little use and perhaps actual harm.

Where the moisture is liable to become deficient before the crops is matured, irrigation at the proper time means the difference between profit and loss. There are many orchards of deciduous fruit trees that are on soils that, on account of peculiar formation, grow good trees but, when bearing time comes, the fruit is undersized. Water applied to such orchards at the time the fruit is growing the fastest, just before the pit hardens, will carry the fruit to a larger size and improve the quality.

Fruit that is ripened with a deficiency of moisture cannot convert the starch into sugar properly because the natural development is interfered with. Should water be supplied soon before the fruit ripens, there is sure to be a loss in quality as the result will be soft fruit and a low amount of sugar because the process of reversion of starch to sugar will not have sufficient time in which to work.

Irrigation must be long enough before maturity to allow normal adjustment of all the functions or an unbalanced result will follow. Just at what period in the development of the different kinds of fruit or any one of them cannot at this time be definitely given. Experimentation along this line has not been carried on, but no doubt the growing of deciduous fruits under irrigation will some time be as accurately worked out as some of the problems in citrus culture are now. There is one thing certain and that is, all fruits whether citrus, deciduous or small fruits, are grown to a closer state of perfection when the physical conditions of the soil are kept in the highest state of perfection. Deciduous fruits have one advantage over citrus in irrigation. They do not require it so often because they are so much deeper rooted and they have a larger surface from which to draw the moisture. However, the irrigations given deciduous trees must be much longer in duration than with citrus because of their deep rooting.

MILLIONAIRE PRICES FOR FRUIT.

Edward Berwick of Pacific Grove sends the Cultivator clippings from an English paper regarding fruit in London markets, and from prices quoted we imagine laboring people buy but little. Also they show that California fruits forwarded across the water do not have the full control, and still worse is up against a vast importation from other parts of the world, which is not easy competition. From the paper we quote:

This is essentially the time of the year for the gratification of epicures with exclusive and expensive tastes; those to whom a cheap and seasonable form of dessert is positively distasteful, and who long for the proverbial "out-of-season" del within reach of the mu such—and there are many and of ours—the well-k universally accepted theory and vegetables are, as a g at their best when ple cheap, has no significance; fact of any particular kin being largely in evidence is rent to its chance of a amongst the luxuriously in indulge in strawberries in July would be an unpardon cism, but that these should dessert table whenever pos January until May is almo "de rigueur" as the evening the diners.

At the present time there opportunity of providing a choice and expensive frui though much of it must in nary way be characterized season," the flavor is n excellent. There was a ti anything in the nature of sonable delicacy was will cepted and appreciated, q pective of its palate-pleasing ties; the mere fact that rarity was sufficient to en ing eagerly purchased. T affairs no longer exists. sumers of all classes hav critical, especially those wh is for choice varieties. Gr all parts of the world have cognizant of this fact, an striven to place on the mar of excellent quality at all the year, with the result t in the winter months certa associated with the summ are obtainable in perfec condition.

Quality Counts.

Nothing is more fatal the caterer for the highe exclusive trade than to fal of the mark in quality. T stantly illustrated by the fected in Covent Garden, highest grades of produce a realize "fancy" prices, but t a shade below are almost u The explanation is simple, a that there is no intermedia between that accustomed to the ordinary fruits as they a their natural rotation and t ious and wealthy classes r who will not tolerate anyth of perfection.

Fabulous.

A few illustrations are topi seasonable. The plums ell worth atention. They are all Japanese varieties, and been obtained by crossing and lizing with other kinds of Thus we have a plum of the color and shape of a nectarine, the apple plum; there is also er, the Chalcott, a very fine men, which closely resembles ectarine. The Burbank plum is d after Luther Burbank, an ican who was the first to try crossing of plums with other . A South African plum that be noticed is the Satsuma, or vine plum, so called on account rich red internal, as well as ex- l color. It is shaped like a l heart, is, deliciously flavored is altogether attractive.

* * *

is list would be incomplete out allusion to custard apples at ach. Many searchers after new pleasing flavors have been dis- inted upon tasting for the first the Maderia custard apple; but may probably be acounted for he fact that the fruit was not e ripe at the time. It is most rtant that a custard apple should be soft to the touch, otherwise what should be a rich and luscious flavor will compare unfavorably with that of a raw turnip.

OLIVE NOTES.

It is quite generaly believed that olives should be planted in alternating rows of different varieties to promote cross pollination and thereby increase the yield. This theory is somewhat shaken for the reason that many isolated trees are heavy bearers some seasons and the same varieties when grown in close proximity with other varieties are apparently not benefited thereby.

Climatic conditions have, we think, more to do with the setting of the olive crop than pollination. The olive bloom is very sensitive to cold winds and rain. In a collection of fifty or more varieties not one set a full crop on the side exposed to the cold winds which blow at the time the olives were in bloom. The sides of the trees away from the wind always produced some olives and always by far the larger amount.

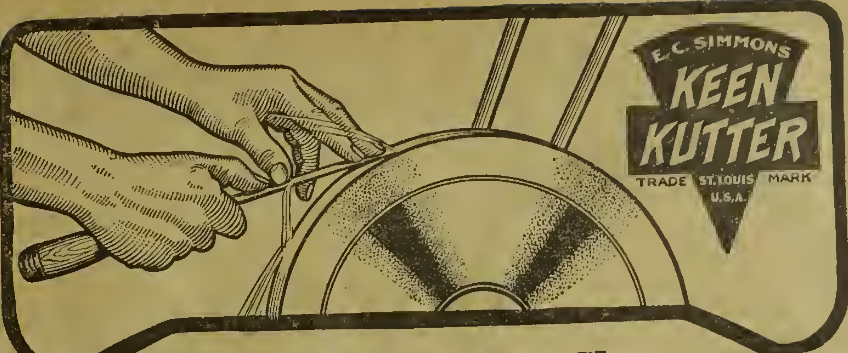
Many varieties of olives always produce some infertile fruit even when surrounded by several varieties that bloom at the same time. Pendulina, for instance, always has a large amount of infertile olives under these conditions. In certain parts of the San Joaquin and Sacramento valleys the Mission olive, for instance, is a regular bearer even when grown alone and when it is handled properly.

We do not disclaim any benefit from cross pollination, but claim that adaptability of varieties to climate is of more importance, and when most advantageously carried out is, in the case with olives, the key to the greatest success.

It is often desirable to graft trees to different varieties of olives, especially so when tested trees do not come up to the best in productiveness or quality. It does not matter very much which season of the year the grafting is done as long as the trees are growing, the weather is not too hot or the season too late in the fall. We have seen grafts put into old trees in July, which gave a good stand and entire satisfaction. The best size for scions is about the size of a lead pencil with at least two sets of buds above the point of insertion at the stump. Twig buds should be used. These are those which have made a growth of a half inch or perhaps a little more with leaves partly developed. The leaves should be clipped in two to reduce evaporation and the consequent draining of the sap from the scion before it can establish circulation of sap from the stump.

Next to the grape, the olive is, perhaps, the least difficult to graft successfully. It is not uncommon for grafts to grow without waxing or wrapping of any kind. This part of the operation should not be neglected, however. Waxing with cloth spread over the cuts in the bark of the stumps and waxed again will insure a good stand if the mechanical part is neatly done with the inner barks of scion and stock matching.

The large varieties of olives are very attractive but are not suited to the manufacturing of ripe pickles, owing to the difficulty in extracting the bitterness. This is particularly true of Ascolano and Sevillano. They should be utilized in making Queen olives which are made from the largest varieties while still green. For general use in making ripe pickles and oil, the Mission olive is not surpassed by any other variety. It bears and matures to perfection in certain parts of the Sacramento and San Joaquin valleys. In certain parts of Southern California it bears well and produces a good pickle and is as good as any for oil. Sevillano and Ascolano are of little value in this territory and, with few exceptional years, bear little or nothing even when they bloom well and are surrounded with other varieties that bloom at the same time.—J. W. Mills.



Sharpened to Stay Sharp

Tools for use in the home or on the farm must have lasting edges and fine temper, for they are called upon to do all kinds of work and do it well.

The most satisfactory tools for the home or farm—tools that seldom need grinding, tools whose adjustments are right and stay right—are

KEEN KUTTER
Tools and Cutlery

the only complete line of tools under one name, trademark and guarantee.

To remove all chance from tool buying, ask for Keen Kutter Tools and look for the trademark on each tool.

Keen Kutter Tools include Saws, Chisels, Bits, Drills, Gimlets, Awls, Planes, Hammers, Hatchets, Axes, Drawing-knives, Screw-drivers, Files, Pliers, Glass-cutters, Ice-picks, and a full line of Farm and Garden Tools—Forks, Hoes, Scythes, Trowels, Manure-hooks, Lawn-mowers, Grass-shears, Rakes. Also a full line of Scissors and Shears, Pocket-knives and Table Cutlery.

Keen Kutter Tools have been sold for nearly 40 years under this mark and motto:

"*The Recollection of Quality Remains Long After the Price is Forgotten.*"
*Trademark Registered. —E. C. Simmons.

TREE TANGLEFOOT

A Sticky Preparation Applied Directly to the Bark of the Trees

Will not injure trees. A band 5 inches wide and 1-16-inch thick cannot be crossed by any climbing insect pest. Remains sticky five to ten times as long as any other known substance. You can test it at slight expense, as no apparatus is required. Used by the carload in New England against the Gypsy and Brown-Tail Moths. In California it preserves prune orchards from the Canker Worm Wherever the Gypsy or Brown-tail Moths, Tussock Moths fall or Spring Canker Worm or Web Worm appear TREE TANGLEFOOT is of great value, and should be used when the caterpillars begin to crawl while they are very young.

Price 25c per lb. Liberal discount on quantities. The only safe and effective banding preparation. Send for testimonials.

With the Citrus Growers

Written especially for the California Cultivator.

BY J. W. MILLS, RIVERSIDE.

J. W. Mills needs no introduction, but we may at least remark that the long and continuous work given to the State Experiment Station work will soon terminate. Mr. Mills will use his knowledge gained from these years of service to his own advantage hereafter. He expects to leave the Riverside citrus station within the next few months and enter upon the work of his own ranch near Marysville. This will not terminate Mr. Mills' connection with the Cultivator.—Ed.

IRRIGATION OF CITRUS ORCHARDS.

THE experienced orange and lemon grower can tell us how to irrigate his grove better than we or any one else can, for the reason that one must know his land and learn how to irrigate it by actual experience. There are very few plots of land that are so uniform in quality that they can be irrigated to the best possible advantage when the whole is treated alike.

How Often.

A novice in orange growing asked us recently how often he should irrigate his five-year-old grove which is on a light, sandy soil. This was a question we could not answer as we were not acquainted with the soil as deep down as would be necessary in figuring on the influence of the subsoil or irrigation. When the subsoil is heavy and water will penetrate through it slowly, irrigations should be less frequent than when the subsoil is a sandy or gravely nature. These two conditions are at times quite common in the same orchard and when the same number of irrigations are given during a season, there will soon be a great difference in the size and vigor of the trees on the two different kinds of soil. The condition of the soil previous to planting the grove makes a vast difference as does also the subsequent care aside from the mere cultivation and irrigation.

At Pomona we have in mind a small orange grove that was planted on land that had grown prune trees for ten years but had always produced a heavy crop of vegetation, principally legumes, between the trees, this crop having been plowed under every spring. The orange tres were planted in July and at that time were thoroughly irrigated, having been given water several times between then and winter. During the rainy season the grove was kept well cultivated after each rain to conserve the moisture. With cultivation every month during the following summer, the trees made a luxuriant growth without any artificial irrigation.

The following season they received but one irrigation and bore some fruit. After this time the roots had reached more than half way across the spaces between the trees and there was a heavy draught on the soil moisture so that more frequent irrigations were necessary.

Courtesy Gridley Herald.

A WELL LOADED ORANGE TREE AT BIGGS, BUTTE CO.

The Tree Has Habits.

Right here is where an inexperienced person is liable to make a mistake. While the trees are young and the soil is not entirely taken up by the root system, there is a constant supply of new moisture laden soil for the roots to push out into. When this soil is entirely taken up by the roots, applications of water must be given to supply the demand. There is a great difference in the requirements of a grove as regards irrigation, due to the early treatment. When a grove has been irrigated more frequently than is necessary, it will continue to require more frequent irrigations than if it had received less frequent aplications when young. There is a striking illustration of this in a ten-acre grove near Arlington Heights in Riverside. This grove has produced magnificent crops eight or ten years with only two irrigations during many seasons. Adjoining groves on the same kind of land have always required more frequent irrigations. So it is that different soils and different treatments of the same soils show great differences in their requirements.

A COMPLETE PACKING HOUSE.

One of the best equipped and most complete orange packing houses in this State, which also means in the world, is that of the Pomona Fruit Growers' Exchange at Pomona. It is not only a packing house with graders, brushers, washers, and all other appliances needed in packing the fruit, but has a complete pre-cooling plant in addition.

The main floor of the house is 120 x177 feet, and 60 packers may work at one time. The capacity of the house is 10 cars of fruit daily. The doors are so arranged that three wagons of growers may unload at one time, with weighing scales at each door so there is no confusion in the handling of the fruit. The fruit is all handled so as to give the minimum amount of injury, being carried from one part of the house to another on the wide belt system and at no time is there any fall sufficient to bruise the fruit in the slightest. In fact, the greatest fall is at the dump of the automatic weighers.

The most remarkable feature connected with the house is the pre-cooling rooms in the basement in the capacity of 35 cars of packed fruit, and the almost automatic carriers, which take the fruit to these rooms after packing above, then returns it to the car when cooled. The carrier will take the fruit from these cooling rooms to the entrance to the car which is connected with the cooling rooms by a hood so that the fruit is not allowed in the warmer atmosphere after the cooling.

When the pressman nails the covers on the packed orange box, the box is placed upon the automatic conveyer which carries the fruit down the chutes a distance of 300 feet to the farthest rooms. The same system is used in the delivery to the car.

One advantage with this pre-cooling plant will be the possibility of holding fruit for a longer period in case of glutted market or unfavorable weather.

Above and in the front of the building are the large and commodious offices with fire-proof vaults. The secretary and manager is H. E. Walcott, and the officers and directors are: H. J. Nichols, president; Fred J. Smith, vice-president; J. H. Graber, Mel Campbell, J. M. Mitchell, D. A. Hawk, and J. G. Robertson. The membership at present is made up of 225 orange growers, and the total output this year will be about 650 cars.

Tulare County Waterways

Written especially for the California Cultivator.

BY A. E. MIOT, TULARE.

One of the foremost pushers for Central California in general, and Tulare county in particular, has been Mr. Arthur E. Miot, secretary of Tulare County Board of Trade. We are glad to have Mr. Miot present to Cultivator readers matters regarding the irrigation interests of his productive section. It is a rich section and will make a rich people.—Ed.

THE irrigation system of Tulare county is susceptible of marvelous development and presents some features of peculiar interest. Seventy-five miles of the highest peaks of the Sierra Nevada range stretch themselves across the eastern boundary of our country, forming a magnificent water shed of 1500 square miles.

ALTA DISTRICT CANAL.

Provided by Nature.

At a glance we realize that the great value of this water shed lies not so much in its area as in its topographical formation. The lower altitude of this region is about 5000 feet, while the region of most importance, namely, the source of the principal streams, reaches an altitude of 15,000 feet, which is the region of perpetual snow. Thus nature has provided a vast reservoir to store the storms of winter, in the form of snow and ice, the gradual melting of which during the long summer months, feed the streams that furnish the gravity canal systems with their supply of water for irrigation.

Following along the line of natural resource it would seem as if our irrigation system was the result of a prearranged plan by nature to supply the wants of man, destined to inhabit the semi-arid regions of the plains.

FURROW IRRIGATION IN TULARE COUNTY.

The main arteries which deliver us our water are the Kaweah and Tule rivers. While these streams are confined to the mountains all the creeks and streams flow into them, but when they diverge upon the level plains the order of things is reversed and all the creeks and stearms flow away from the rivers, for the rivers do not cut deep channels for themselves and thus act as drainage canals, but, to the contrary, they flow out on the top of the land, spreading out like the leaves of a fan into numerous creeks and channels, thus forming a great distributing system. Thus nature in its wisdom and especial goodness established our first irrigation system.

Now it was but a step fo man to supplement nature's placing dams or weirs in th channels, subdividing the flo river, and with the aid of ditches further spreading on the face of the land; about all we have done for so far as the great gravity tems are concerned. No been done to control the ri reservoir the flood waters accept what nature deli and in time of excess m sion for times of need. conditions it often occurs water finds its way into Tu than is put to useful purpos

w, to refer again to the remark
by President Bryant at the
ng of this article. There has
een a total planting in California
0 acres of this luscious product
the local market has continually
l for all that has been produced.
shipping of a carload is unknown.

RHUBARB RANCH OF ADIRAMLED ASSOCIATION, POMONA.

Even overland shipping of an express package more than an experimental proposition is also unknown. But the experimental shipments made by Mr. Wagner of Pasadena show conclusively that the markets of Chicago, St. Louis and New York will eagerly receive the product if it can only be supplied in quantity. But Mr. Bryant has now learned that greatly increased acreage is necesary to ever start the industry.

We believe this industry at this moment can be compared to the orange industry of 25 years ago, when the planting of the Wolfskill orchard of 45 acres in the city of Los Angeles caused people to hold up their hands in astonishment because of the overdoing of the industry, the planting of that orchard did, in fact, overstock the market, which was only a local one for a very short time. But its total of a few carloads is more than exceeded every hour in the day at this writing, and yet California is not as much in danger of overproduction with its 30,000 cars of oranges as many thought would be the case with that one orchard less than a quarter of a century ago. The demand for the luscious fruit increases faster than the production. The development of h celery industry has the same lesson in that quantity is necessary in order to encourage large Eastern dealers to labor to establish the industry. This State now sends out during the season 30 carloads daily and is still unable to meet al the demand—Michigan and other large shipping districts notwithstanding.

A Comparison.

Cabbage may be mentioned as a case where overproduction has occurred, but we call attention to the fact that there we are dealing with a product that is grown wherever there is soil. This product is now down so low that the producers are reeciving barely $5 per ton. It may not be in good form these days to draw a moral from a story, and in this case we will simply suggest that where such a product commands only $5 and rhubarb can be produced as quickly and as cheaply and commands $80 to $100 per ton, no moral need be suggested even to the most ordinary mind, especially where one planting of rhubarb suffices for many years, while cabbage must be planted annually and no more care or labor required.

As to the field of culture it may be said that any deep, rich, sandy soil, wherever an orange tree will grow successfully, will make most successful rhubarb conditions. If the frost does come so as to injure the plant it is only the one crop which may be lost, as the plant quickly recovers and within six weeks the crop is ready for another gathering.

Not Plants Enough.

The only drawback at this time in the extensive planting of rhubarb seems to be the inability to secure plants. Mr. Bryant remarked to the writer that it would be doubtful if he would be able to get thrifty, stocky plants to finish his entire planting of 125 acres this season. There are, indeed, but very few in California who have realized the worth of this remarkable plant. One of these men, of whom the Cultivator has often spoken, who has devoted most intense energy in developing this plant and bringing it to its greatest producing capacity, is Mr. J. B. Wagner of Pasadena. Seven years ago Mr. Wagner began the work with a bunch of plants secured directly from Luther Burbank who originated it. Two factors which were serious objections to the culture were the facts that the seed would not always come true to parent; that is, it would at times "throw" back to one of the original parents which Mr. Burbank had used in hybridizing; and some of the plants, while giving a very desirable product as to quality of flavor, yet the size of the stalk is so small as to be unmarketable. But by patient study and hard work Mr. Wagner has selected from best possible samples of plants, also done some hybridizing of his own until he has succeeded in producing plants, which, as a rule, are far superior to the original. These plants will not always be of the very highest desired grade, but much better than the common crimson winter, at the same time the percentage of culls is so very light that it is not a commercial factor.

D. D. BRYANT, POMONA.

Work for Many.

Mr. Wagner deserves credit for patiently working out the problem of this delicious product and in producing and replacing on the market the young plant which many confidently believe will yet be the means of bringing thousands of dollars to this State and by giving employment to a vast number of California people. It is one of the kind of products which means work of many hands to culture and market, and that means many small ranches with homelike surroundings. It is also a credit to men of Mr. Bryant's class to come here and put in their means to develop this great industry. May Mr. Wagner continue to develop and produce a finer article and thus enlarge this industry which will give employment to a large number who will some day rise and call him blessed for encouraging them in taking up this profitable industry. He has done more to introduce and promote the culture of the rhubarb industry in California than all others combined. In fact, he took the matter up where Burbank dropped it and is the one man of all to whom credit is due for the position which rhubarb holds commercially today.

Eastern Culture.

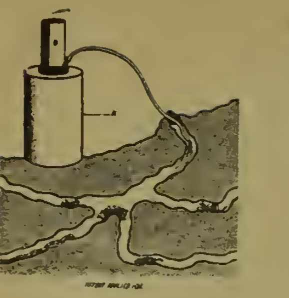
As to its Eastern culture, Mr. Wagner says:

"They have large hothouses, some of them covering half an arce, devoted to forcing during the winter months. For this forced hothouse stuff the growers reecive from 35 to 70 cents per pound. This commands this enormous price because of its out-of-season possibilities, but the consuming trade complains somewhat because it is lacking in flavor due to the forcing process. I was told repeatedly that if California can produce this in the open the glasshouse grower will promptly be put out of business

"I was certainly very much surprised at the size of the stems of the Eastern grown rhubarb. They are not much larger, and in many instances are smaller than is our winter variety. And surely it is not so appetizing nor so attractive on the market."

Still in the Ring.

A report was at one time circulated in Pasadena, Mr. Wagner's home town, that after his free distribution of $1500 worth of trees and plants to beautify the parks and schools of that city last spring and his departure for a tour of the Eastern States, Mexico and Canada, with his family, that he had retired from active business. This is now shown to be without foundation for his yards at 53 West Colorado Street, almost in the heart of the city, are again being prepared for another season's campaign, while he will handle nearly everything which a general nursery business calls for. Of course, he will, as heretofore, specialize on rhubarb



Kill the Pocket Gopher, Moles and Squirrels

The Peerless Destroyer generates gas from carbide (a cheap substance, which can be bought anywhere,) instantly forces the gas into their holes at the rate of five feet per second, for hundreds of feet, making a wholesale killing of every live thing therein. They stop breathing when the gas overtakes them. No pumping, no trouble. The gas is harmless in the open air, but confined in their holes kills them by the dozen in a single operation. Not an experiment, but a sure thing. FULLY GUARANTEED. Perfectly safe, easy to operate, fully meets the demand for a wholesale destroyer of the pests. Will last for years. The cost is nothing for the work it will do. Full equipment, including sufficient carbide to clear any ordinary ten acres, ready for instant use, sent express prepaid on receipt of price, $5.00, without carbide $3.50. Your money back if it fails to do the work. Write today.

Concerning my Gopher and Mole Exterminator, Mr. C. H. McIsaac, Secretary of the Board of Trade, and proprietor of the Lilydale Ginseng Garden at Santa Cruz, Cal., says:

To Whom It May Concern:

I take pleasure in saying that I have used the patent Carbide-Gas Gopher and Mole Exterminator invented by D. Hawes, and it has proved the most efficacious device I have yet found for the successful extermination of gophers and moles.

COLIN H. McISAAC.

W. H. Lamb, director in Bank of Santa Cruz County and Hardware Merchant in Santa Cruz, Cal., says:

I am sole agent in Santa Cruz County for the Rodent Destroyer. Am selling them rapidly and have never heard of one that did not give satisfaction. THEY DO THE WORK. The owners of the patent are reliable people.

W. H. LAMB.

W. E. Vandervort of 34 Windon Street, Santa Cruz, Cal., says:

I bought a house and lot at the above number, and found the pocket gophers in full possession. I could not poison them nor catch them in traps. I procured a Peerless Rodent Destroyer and cleaned out the pocket gophers and moles, so that now I do not think there is one in the place. In proof that it kills them after using the destroyer, I plowed up the garden and found many dead ones, I think I must have killed two or three dozen.

Signed
W. V. VANDERVORT.

D. Hawes, P. O. Box 307, Santa Cruz, Cal.

SEEDS That Grow Just Sow

Fine, new stock, Northern grown seeds. None better. Choice Alfalfa. Low price for best quality. Send 35c in stamps for trial order of 12 of our 5c-packages, your choice, postage paid.

Poultry Supplies and Incubators

Large stock of the very best goods of all kinds at the lowest prices. Come and see us, or mail your orders; you will be treated right. Send for free Catalogue.

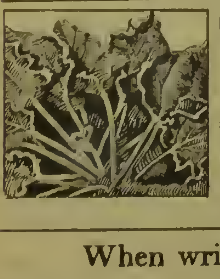
COTTON IS KING!

FREE COTTON SEED FREE

We have secured from a Texas grower the best strain of Cotton. This is what he says of it: "After trying many of their so-called Improved varieties, we find the Texas Snow Flake Big Boll variety far superior to all others, and we are now growing one thousand acres this season." It is a five lock variety that matures early and fruits very heavy. We will give for the asking one ounce of this seed to anyone wishing to experiment and learn how to grow cotton, for Cotton will be King in the Imperial Valley.

Send in your order at once. Full directions for growing will accompany each packet. Address

Johnson & Musser Seed Co., 113 N. Main St., Los Angeles, Cal.



Crimson Winter Rhubarb and Berry Plants Our Specialty

1000 choice Navel Oranges, together with a few other Citrus Trees. April and May are best months to plant Rhubarb for heavy Crops next winter. It has never been equalled as a money maker. $1.50 per dozen, $6 per 100, $40 per 1000. Pedigreed plants.

The Vegetable Garde

Written especially for the California Cultivator.
BY Q. A. LOBINGIER, SAN GABRIEL.

Mr. Q. A. Lobingier is a busy man these days. The garden is going i
from the busy moments a few have been stolen to make a valuable little art
the irrigation of the garden. There is a fund of information here. Read it.

IRRIGATION IN THE VEGETABLE GARDEN.

IT IS astonishing how persistently the recently arrived settlers or the inexperienced native will "water the sun." By this is meant sprinkling the surface, or allowing the water to flow rapidly across the land in shallow ditches and shutting it off as soon as it reaches the end of the ditch. Either method is often more injurious than beneficial. Few people have even the faintest conception of the power of the sun and wind to evaporate every drop of water applied in this manner. The loss is not alone in evaporation, but the soil becomes baked and difficult to work, and without life as we are apt to express it.

prepare for It.

The true way to irrigate the vegetable garden is to have everything planted in rows—wide or narrow, according to the kind planted, and have a flume across the head of the garden having galvanized iron gates with slides, so that the water is under perfect control. Make the furrows between the rows—one or more according to the width, and allow the water to run rather freely until it reaches the end of the row, after which close the gates so as to allow just as much water to pass through as will reach to the extreme end of the furrow. This is more difficult to do on some soils and grades than others, but approach it as nearly as you can. Allow the water to run until the soil is well soaked.

No rule can be given as to how long this will take, as the soil and grade are leading factors in the matter, and each particular garden is a problem of itself. A good irrigator is like the poet, born not made. Not one person in fifty of those who work in our orchards and gardens comprehend the theory and practice of successful and economical irrigation. Many can wet the ground, but it is with a woeful waste of water.

Frequent irrigation keeps the soil cold and packs it so that the air cannot circulate through it. Thorough irrigation at long intervals, followed by good and frequent cultivation between, thus allowing the soil to get well aired and warmed, will bring best results. By planting everything in rows it is possible to supply each kind with just what water is needed, for some crops need less than others.

"Never Permit Your Plants to Suffer for Water."

I am asked the question "how often do you irrigate" more frequently than any other and I must answer, just as often as the crop needs it. We have no set rule. The weather, the soil, the particular crop, the care had in cultivation, are all to be considered. Long experience enables us to detect at a glance, by the appearance of the soil and plants, any need for water. The nearest approach to a rule that we have is "never permit plants to suffer for water." The freshness and vigor of the crop, the condition of the soil, the atmospheric conditions are all to be reckoned with and any one having average intelligence can, by a little observation, soon learn.

Get your water deep into the soil
and then by the most careful, p
ent cutivation, keep it there
plants to evarporate it th
foliage, instead of allowin
and wind to drink it up—s
that will surely happen if yo
sprinkle or wet the surface

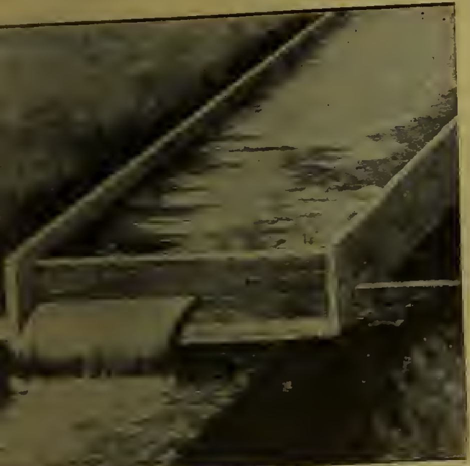
MEASURING WATER.

IRIES as to measuring water are often of the Cultivator. That is, how can ayman get a fairly accurate idea of the of water in any ditch? This table en published in the Cultivator before, now given again for the benefit of those ay not have noticed the former table. urse the miners' inch measuring box is the ccurate, but at the same time more ex- to prepare.

asure an Inch.

that measurement a box should be con- d, at more or less expense, with an opening variable as to length, by a sliding stop, as



A Miner's Inch Measuring Box.

n in the cut of "A Miners' Inch Measuring The lower edge of the aperture shown in u' should be two inches above the bottom of easuring box and the plank five inches high th aperture, thus making a six-inch head e the center of the stream. Each square inch is opening represents a miner's inch, which ual to a flow of one and one-half cubic feet minute.

Measurement.

is convenience, however, is seldom at hand, e also give a cut illustrating the "Wier Dam surement." which is so simple that any one construct and get at least a general idea of amount of water flowing in a stream.

he miner's inch here is usually figured on the s of four-inch pressure.

he wier should be so placed that the water sing over it should be in effect a discharge n the still water of a reservoir and shall not n the least affected by the velocity of the cur- t flowing into the reservoir or wier box. This ocity of an inflowing curent, if noticeable at wier, becomes a "velocity of approach," which will render inaccurate the desired measurement. This "velocity of approach" may be obviated by placing one or more lattice screens made of laths or other similar construction between the wier and the inlet.

The length of notch should be at least four times its depth for small quantities, and longer for large quantities. In addition to the above, for accurate measurements it is advisable, if possible, to also have the length of the notch about two-thirds of the width of the water on the upstream side; it may be necessary to experiment somewhat in order to obtain this condition.

The overfall, or vertical distance, the water falls on the down-stream side, should be about twice its depth—that is, 12 inches if the notch is six inches deep, and so on.

In the pond not less than three feet, and preferably six feet from the wier and to one side so as to avoid any current, drive a stake, with its top precisely level with the bottom of the notch in the wier; then measure carefully with a rule the depth of water over the top of the stake. This will give the theoretical depth of flow.

The two tables given on this page may be used to determine either the number of miner's inches or the number of cubic feet per minute.

The wier table is based on zero velocity of approach. Where the velocity of the stream is considerable, the following correction must be added to the measured depth in order to compensate for this velocity of approach:

½ ft. per second	1-16 inch
1 ft. per second	¼ inch
1½ ft. per second	⅝ inch
2 ft. per second	1⅛ inch

TABLE FOR WIER MEASUREMENT.

Giving Cubic Feet of Water per Minute, that will Flow Over a Wier One Inch Wide and From ⅛ to 18⅞ Inches Deep.

INCHES		⅛	¼	⅜	½	⅝	¾	⅞
0	.00	.01	.05	.09	.14	.19	.26	.32
1	.40	.47	.55	.64	.73	.82	.92	1.02

6	5.87	6.06	6.25	6.44	6.62	6.82	7.01	7.21
7	7.40	7.60	7.80	8.01	8.21	8.42	8.63	8.83
8	9.05	9.26	9.47	9.69	9.91	10.13	10.35	10.57
9	10.80	11.02	11.25	11.48	11.71	11.94	12.17	12.41
10	12.64	12.88	13.12	13.36	13.60	13.85	14.09	14.34
11	14.59	14.84	15.09	15.34	15.59	15.85	16.11	16.36
12	16.62	16.88	17.15	17.41	17.67	17.94	18.21	18.47
13	18.74	19.01	19.29	19.56	19.84	20.11	20.39	20.67
14	20.95	21.23	21.51	21.80	22.08	22.37	22.65	22.94
15	23.23	23.52	23.82	24.11	24.40	24.70	25.00	25.30
16	25.60	25.90	26.20	26.50	26.80	27.11	27.42	27.72
17	28.03	28.34	28.65	28.97	29.28	29.59	29.91	30.22
18	30.54	30.86	31.18	31.50	31.82	32.15	32.47	32.80

Suppose the wier to be 66 inches long, and the depth of water on it to be 11⅝ inches. Follow down the left hand column of these figures in the table until you come to 11 inches. Then run across the table on a line with the 11, until under ⅝ on top line, and you will find 15.85. This multiplied by 66, the length of the wier, gives 1046.10, the number of cubic feet of water passing per minute.

Table of wier measurement giving miner's inches:

1	2	1	2	1	2	1	2
⅛	.01	3⅞	2.56	7⅝	7.04	12¾	15.27

Tri-Counties Reforestation Committee

Written especially for the California Cultivator.
BY FRANCIS CUTTLE, RIVERSIDE.

California is taking the lead in this country in proclaiming the gospel of foresting and afforesting. It is because of the high average intelligence of California farmers with capacity to see that a "condition, not a theory" confronts us. Nor is it entirely farmers who have taken this interest, for many business interests and civic societies have joined in the work. But as much as we lead, it has taken work to educate to the point already reached. Foremost of these movements is that of the Tri-Counties Reforestation Commitee. Foremost and leader in that is Mr. Francis Cuttle of Riverside who writes the following article. May the good work of this organization spread over the State.—Ed.

PRIOR to the organization of this committee, little attention was paid to the conditions existing on the watershed from which practically all of the irrigating and domestic water for the counties of San Bernardino, Riverside and Orange had been secured. Each fire which spread over the mountain side brought its outburst of indignation from the citizens and the press. Each time the attention of the public was called to the destruction of large timber by the lumbering men, more indignation was expressed by citizens and press.

The dry season, which ended in the fall of 1905, called, in no uncertain terms, the attention of irrigators to the fact that they were facing an increasing population and a decreasing water supply. The most expensive litigation that had been carried on, and is still being carried on, brought no aggregate relief. It might for a short period of time give one company, or community or individual, a little more water than he formerly had, or assure him of a little more permanent flow; but every such addition to the supply of one company, or individual or organization, meant the lessening of the amount, in just the same proportion, to some one else.

Showing area with timber destroyed. Also, area with timber in its natural state.

Results of Scientific Forestry.

About this time Mr. Gifford Pinchot, Forester of the United States, stated in a public address that many instances had been recorded in history, and it had been scientifically demonstrated, that streams had been entirely dried up by the destruction of the timber and brush on their water sheds; and in other instances, streams of water had been made to flow perennially by scientific forestry. The writer interviewed Mr. Pinchot with reference to the statement and he was assured that such were the facts, and that it would undoubtedly be possible to largely increase the summer flow from the San Bernardino mountains, and possibly double the same by protecting the timber and brush, and planting trees and protecting the same from destruction by fire and lumbermen. This was called to the attention of the Riverside Chamber of Commerce at the annual meeting in December 1906, and a committee was the and there appointed to confer with the San Bernardino and Redlands Boards of Trade, to see whether or not some action could not be had that would insure the protection of the timber and brush on the south slope of the San Bernardino mountains and to increase the same.

The suggestion of the Riverside committee met with hearty co-operation from the San Bernardino and Redlands Boards of Trade, when the matter was called to their attenion. and a committee of ten was named to carry on the work, five from each of the counties of Riverside and San Bernardino. During the early part of 1906, they raised from the different irrigation interests in the two counties $2000. This was supplemented by an additional $1000 from the Forest Service at Washington. This money was used for the construction of fire lanes and trails on the San Bernardino mountains.

Permanently Organized.

During the summer of 1906 the committee decided that a permanent organization should be formed to carry on the work, and on December 15th, 1906, at San Bernardino, the Tri-Counties Reforestation Com was organized, having for its

To diminish the winter and run-off and increase the summe of water from the San Bern water shed. First, by securi the Federal Government the ship of all lands within the o boundaries of the San Bern Forest Reserve.

Second, by preventing the destruction of timber and bru in the said reserve.

Third, by reforesting all areas.

Fourth, by afforesting, where ticable, all areas not now co with sufficient timber to conser the best advantage the prec falling on the said reserve.

Government Aid.

This committee consisted of members from each of the of San Bernardino, Rivers Orange. The committee met as provided in its by-laws, in ary 1907, at San Bernardin since that time has held quarterly meetings in the towns of the three counties.

In January 1907 the matter curing financial aid from the Government was brought to tention of our delegation in Co and of Forester Pinchot, and a ise was secured that $5000 set aside for this work, provided equal amount could be secured f the State legislature of Calif then in session. The chairman of committee immediately went to ramento and through the efforts of representatives from the three co ties, in the Legislature, secured th sage of a bill appropriating $500 this work, to be used in conne with the $5000 promised fr the Forest Service. This, togeth the $3000 raised by the first mmittee, has enabled the Forest Service to construct nearly forty miles of fire lanes along the foothills, raging in width from fifty to seventy-five feet; to prevent the spread of fire and the destruction of brush and timber

This work has been done under the supervision of Forest Supervisor R H. Charlton, of Los Angeles, in the most thorough and workmanlike man-

PESSIMISM VS. "OPTIMISM."

A correspondent writes: "I do not believe any association or individual can do anything toward the protection of the forests. They are bound to go, in this country, even down to the railroad ties and prop timbers. Assessments are so high that no one can afford to hold them to grow up into timber again. I have no sympathy with the movement at all."

Over against this should be put the speech made by Speaker Cannon before the National Wholesale Lumber Dealers' Association in Washington on the 12th.

Mr. Cannon declared himself to be "an optimist." He ridiculed the idea that our forests are facing destruction. He scorned the notion that special effort should be made to conserve our natural resources. He sneered at "men who make reputation in public life, in departmental life, in legislative life, by denouncing the criminal wastefulness touching the destruction of the forests," and added: "I sometimes hear them talk; I sometimes wonder how much they know."

Back in Wabash.

He described his early pioneer life in Wabash county, Indiana, when it was necessary to clear the forests to provide land for farming; and then inquired: "Is there a man here . . . who would put us back to fifty years ago, when there was nothing but the wild beasts and the adventurous pioneer to be found in that vast domain known as the Northwest Territory, that would turn the hands back upon the dial fifty or sixty years ago?"

"What Has Posterity Done for Me."

He exclaimed sarcastically: "What is to become of posterity? Oh, the natural resources are being destroyed! In forty or fifty years we are to freeze to death because there is no more coal and there will be no more lumber, no more timber. Burning the candle at both ends! I suppose we ought to freeze now, that fifty years from now they may have something to warm them." He expresed his faith that the Caucasian race would find some way to meet conditions which may arise, and declared that he was not "losing sleep."

In closing, he thought it "necessary" for lumbermen "to pursue a different policy toward the preservation of your holdings in the forest; that instead of cutting it clean, you should be more careful about the cutting." But added: "You will do it because it is to your interest to do it, and that is greater than anything else. It is greater than law.

Grab It All Now.

Between the pessimism of our correspondent and the "optimism" of Speaker Cannon, the reader may take his choice. The chief difference between the two is that the latter is in the place of power. He sees no occasion for anxiety, and no ground for action by the community through its agency called government. For such slight corrections as may be necessary, he relies wholly upon cold-blooded self-interest and unregulated individual initiative. In so far as this speech is an index, his political economy is that of a hundred years ago, as voiced by David Ricardo: Laissez faire, each for himself, self-interest the grand automatic regulator of our whole industrial mechanism!

"After us the deluge!"

"I suppose we ought to freeze now, that fifty years from now they may have something to warm them."—Forestry and Irrigation Magazine.

CONGO NEVER LEAK ROOFING

When looking for a roof one naturally wants something that is durable and that will stand the test of time.

Congo Roofing has stood this test, and has proven its worth as a protection against all kinds of climate and weather.

Many buildings the country over are covered with Congo, which have already given many years of service, and are good for many years more.

Heat and cold, rain and snow, have no appreciable effect upon Congo. Even fire itself is stubbornly resisted by these roofs.

Not the least attractive feature of Congo is the price. It is the cheapest of the high-grade rubber roofings.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Bordeaux for Codling Moth.

I would like to know what to do for pear trees. Last year every pear had a worm in it. We sprayed them with the Bordeaux about a month ago. Is that the right spray for that trouble? Did we spray too early? They are just in bloom now.—Mrs. J. C., Riverside.

Bordeaux mixture is of no value for codling moth unless it has been mixed with Paris green, arsenate of lead, or some poison. Bordeaux is not an insecticide at all; it is very valuable to prevent fungus on fruit and trees, such as scab, curl leaf, mildew, etc. For codling moth when the petals of the blossoms are dropping, spray with a solution of Paris green one pound to 200 gallons of water, or with some arsenate spray, also again two or three weeks later. See copy of The Cultivator of March 12 for fuller spraying directions.

Coddling Moth.

What kind of a solution can I use for spraying apple trees to keep away coddling motht?—F. C. W., Fresno.

See answer to Mrs. J. C., this issue.

Spineless Cactus.

Regarding the spineless cactus, about which inquiry was made last week, we are informed that Johnson & Musser Seed Co. of Los Angeles have roots of excellent quality at $1.00 per root.

Butter Won't Come.

What shall we do when cream under usual treatment absolutely refuses to be churned into butter? After churning for some time the cream seems to become thinner and foams. Cow is young; been milking about two months, and is in good condition. Is staked out on good pasture and gets a feed of potatoes in morning.—W. G. G., Hemet.

Wash and scald everything well. Then secure from a neighbor who makes good butter some buttermilk, a pint to a quart. Stir this into the cream after warming it up to 70 deg. Let it stand over night, covered. Then churn at 50 deg.—M. E. S.

Pear Blight.

I planted five acres of pears, Winter Nellis and Bartlett, last month. Please tell me through the Cultivator what treatment will be needed to keep them free from blight. Will I need to spray this year? If so, what and when?—C. M. N., Santa Ana.

There is no spray will aid you in keeping your trees free from blight, or at least there has not been any which has been generally accepted by experts that have been studying this disease. We may say, however, that a company at Vacaville is now selling a compound which they assert has shown good results. As a rule we may suggest as safe to immediately on its first any indication of blight. T

lease give information in regard to wing figs. Will they grow well in sno County, and what kind is best? o what kind of olives is best?— scriber, Lemoore.

Ve do not think you will make a take in planting the true Smyrna fig. It has done well in your county, also in Fresno, as has been proved by Mr. Roeding and others. Mr. Roeding would doubtless forward to you information regarding the Calimyrna. The olive is also affected by immediate location, but we think you will find it fairly successful with you. The best strain of Mission is universally conceded to be the best for pickling and as good as any for oil.

REMOVED AND ENLARGED.

The well-known Pump manufacturing company of Galt, California, doing business for the past 27 years under the name of A. T. Ames, building his famous pumps, recentlly organized a new company under the name of The A. T. Ames Manufacturing Company, and secured a valuable site on the Southern Pacific R. R. at Niles. The factory site covers seven acres and the new buildings as shown elsewhere in this issue contain 60,000 square feet of floor space which is devoted exclusively to the manufacturing of the "Ames Pumps" and is equipped throughout with new machinery of the latest design and invention for the building of pumps. This strong feature together with Mr. Ames's long years of valuable experience in this line of work adds a strong indorsement to the standard of their goods, and insures the guarantee which already goes with goods they manufacture.

Their new catalogue, now being compiled will be ready for distribution soon and those desirous of installing pumps for irrigating, city water, railroad or mining systems will do well to consult them.

Some years ago the writer visited the Ames factory at Galt and Mr. Ames proved to be one of these competent men who see the needs of the farmer and has the power of meeting the need in a practical way. The enlarging and improving of those shops is a result of this careful and intelligent work.

CEMENT.

THE farmer often has occasion to use cement in making improvements about the farm; and often is more or less at a loss when it comes to selecting the cement to be used, writes Robert W. Gay, Associate Professor of Civil Engineering, Colorado Agricultural College. On large pieces of work where the expense is not prohibitive, extensive tests are made of the cement used. For smaller work regular tests cannot well be made, and resort has to be had to approximate tests, and to general knowledge of the materials at hand. It may, therefore, be of interest to review the principal qualities of cements from the viewpoint of the small consumer.

The two principal classes of cements are Portland and natural, and there are numerous varieties under each class.

Natural cements are of a brownish color, and are lighter in weight, weaker and less uniform in strength, cost less per barrel, and set more quickly than Portland cement. Portland cements are of a bluish color, and are heavier, stronger, more uniform in quality, set more slowly, and cost more than natural cements. There may be more or less exception to the cost part of the above, depending upon the location of the cement plants. In many places the freight charges make up the greater part of the cost.

Natural cements will not weather so well, are slower in gaining their strength, and, as a consequence, should not be allowed to freeze while setting, and should never be laid under water (particularly salt water), in exposed positions, or in positions where a heavy load will come on it within a short time.

Portland cements will be used where strength is required in a short time—for construction under water and in other positions where there is exposure to weathering. Freezing while setting will retard the setting, but will not necessarily cause injury. Where cost is the deciding factor, account should be taken of the fact that more sand may be mixed with the Portland than with natural cement for the same strength. With natural cement at $1 a barrel, and mortar mixed in the proportion of 1 part cement to 2 parts sand, the cost of the mortar will be about equal to that of a Portland mortar mixed 1 part of cement to 3 parts of sand, provided the Portland cement can be gotten for $1.30 a barrel. In this case, the 1 to 3 Portland mortar will be stronger than the 1 to 2 natural mortar.

Care should be taken when it is decided to put a facing of Portland mortar on a backing of natural mortar, or concrete. The facing is likely to scale off.

Unslacked lime (free lime) is the greatest enemy of good cement. Its presence will cause the mortar to disintegrate gradually. To determine the presence or absence of harmful constituents a very simple test may be applied. Two pats of cement (without sand) should be mixed to the consistency of putty and placed on glass. Make them about three inches across and half an inch thick at the center and tapering to a thin edge. Cover with a damp cloth for one day, then put one pat in water and let the other stay in air, preferably moist air. If the pat in air shows large yellow blotches after a time, or if the pat in water begins to show cracks, starting at the edge and running toward the center (showing disintegraion,) the cement is not up to the standard.

THE NATIONAL IRRIGATION C GRESS.

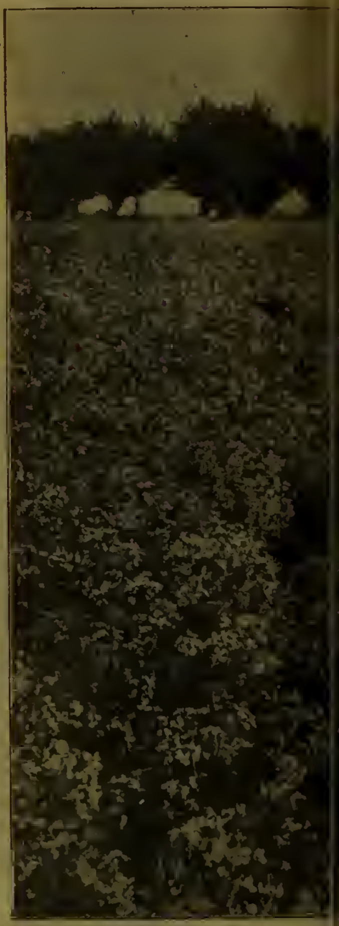
THE National Irrigation Cong will hold its sixteenth sessio Albuquerque, New Mexico, tember [illegible]th, 30th and Octob 2nd and 3rd, 1908. This great ass bly is one of the most import official organizations in the Un States. Its purpose is to prom wise development of governm policies relating to the conserva development and best use of the ests, streams and lands of th c try.

It seeks to save the forests, the floods, reclaim the deserts make homes on the land.

Its annual sessions have had an portant influence on national leg tion and national prosperity.

Those who participate.

The congress is composed of gates representing the Stat territories, of the Union,



municipalities, organized bodi many kinds.

Its personnel includes the h officials of the national gove senators, representatives and istrative officials.

Prominent men from every of the United States attend an cipate in the proceedings. these are governors of State men who stand at the head great manufacturing, commerc financial interests of the c leading professional men, edu engineers and scientists.

What Has Been Done.

The national reclamation through which there has been mulated in the national treas revolving fund of approximately million dollars, now being ex in the construction of great irri systems that will reclaim milli acres of semi-arid lands, is a result of a public sentiment oped by the annual sessions congress.

The new national policy of preservation, under which mor a hundred millions of forest and grazing lands of the pub main have been reserved fron e purpose of preventing denu- and destruction, insuring their use and conserving the timber ange resources of the country ie protection of watersheds, is r duc to the discussions which annually been had at the Na- Irrigation Congress.

PUMPING PLANTS.

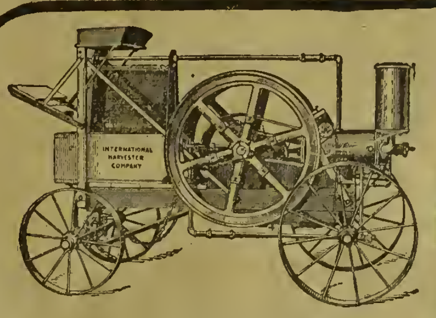
FROM a report of a number of tests of pumping plants made by the University of Arizona, we quote a few which have a lesson for irrigators who depend upon pumps. There is no question but there is a vast loss in the aggregate from inefficient or poorly constructed plants.

The following suggestions are published for the benefit of irrigators who contemplate installing pumping plants. They may prove useful also to operators whose present plants are unsatisfactory and uneconomical. Many tests of pumping plants in Southern Arizona during the past few years have shown that the small plant is often very poorly designed. Since the recounting of errors oftentimes enlightens more than the description of perfect installations, some examples of recent tests are presented.

A 12-H. P. gasoline engine belted to a No. 3½ horizontal centrifugal pump was found running continuously night and day with consumption of 20 gallons of No. 1 distillate per twenty-four hours, costing $4.20 at the railroad. Suction and discharge pipes were of 4½ inches diameter. The latter had one short elbow and the former was protected by a 5-inch foot valve and a cast strainer. The issuing jet of water resembled a fire stream. Pressure and vacuum gauges were attached to the discharge and suction pipes, respectively, close to the pump. The static lift above the pressure gauge as measured with a tape was 7.3 feet, the lift as determined by the gauge was 10.8 feet, indicating a loss of 3.5 feet due to friction and the elbow. The corresponding loss in the suction pipe was 11.7 feet. The total static lift was 16.1 feet, and the combined loss in the piping was 15.2 feet, causing the consumption of gasoline fuel to be needlessly doubled.

At another time observations were made on this plant to determine the cost of pumping, the depth of irrigation, and the specific capacity of the well. A summary of the results is as follows:

Continued on Page 471.



I·H·C· GASOLINE ENGINES

Are solving the hired help problem for hundreds of farmers.

Vertical Engines made in 2 and 3-Horse Power.
Horizontal Engines (Portable and Stationary) made in 4, 6, 8, 10, 12, 15 and 20-Horse Power.
Air Cooled Engines, 1-Horse Power.
Traction Engines, 10, 12, 15 and 20-Horse Power.
Also sawing, spraying and pumping outfits.

YOU offer high wages, and still find it difficult to get hired men. Why not do as other progressive farmers are doing—let one of the dependable and ever ready I. H. C. gasoline engines be your hired man?

Suppose you want to grind feed, pump water, operate the churn, grindstone, fanning mill, separator, bone cutter, or saw wood. With an I. H. C. engine you will need no extra help. You can run the engine and attend to the machine yourself.

In the same way it can be used too for irrigating—pumping from wells, lakes, ponds and running streams. The operator can handle the head of water in the field and also attend to the engine.

The engine will work for you indoors or out, in wet or dry, hot or cold weather. You will have no difficulty in operating or controlling it.

Only a few cents per hour is required for fuel. All I. H. C. engines use either gas, gasoline or denatured alcohol.

Please notice in the above list of styles and sizes that there is an I. H. C. gasoline engine adapted to practically every farm requirement.

You can have a small engine which you can easily move from place to place, as your work requires, or you can have a larger engine for stationary use. The efficiency of all I. H. C. engines is well known. You cannot possibly have any better guarantee of a dependable engine than one of these engines affords.

Call on the International local agent for catalogs, and inspect these engines. Write nearest branch house for colored hanger and booklet on "Development of Power."

EASTER SUGGESTIONS.

The beautiful spring festival of Easter, which comes on the 19th of April, this year, has as its own significance the universal appeal to renewed life.

Here in California, we do not appreciate its meaning so closely as in the colder countries, for there it emphasizes the awakening of nature from the cold sleep of winter, while here it simply repeats the glories of the spring days which mark the beginning and ending of our rainy season.

Taken in the full meaning attached to it, however, we look upon Easter as the time when all nature walks forth in new beauty and new energy.

Spring flowers and real or fanciful eggs are the special Easter ornaments of the home table, capable of an immense variety in decorative effect. A strong argument for special observances in the home lies in the deep and permanent impression they make upon children's minds. The memories of a child are largely made up of the impressions belonging to special days. In a very real way the joy and brightness of a high holiday remains with a child as a lasting possession, a thought which gives a rich reward for a mother's effort. Easter eggs are so nearly indispensable for Easter morning that the children would surely find the world out of joint were they to fail. From the simplest to the most magnificent there is a charm about them all, their mystery only half believed in, yet carrying something of the magic of fairyland.

Of course, flowers will signalize the day, both in home and church, for Easter without them would be like Christmas without holly. These flowers, be they roses or lilies or tulips (in California there are so many varieties to pick,) are all typical of spring—of life and energy, and it would be a pity, while our church altars are so beautifully decorated, to leave the little altars of our home life bare. We owe it to ourselves, to our children, to the home, to decorate our tables with the prettiest, freshest flowers we can gather from the garden, for on this day the sentiment of simplicity and freshness strikes the right keynote. Great are the treasures of simplicity could we but keep our eyes open to them.

CONSERVATION OF MOISTURE.

Farmers who have moved from rain sections are confronted by the proposition of conservation of soil moisture. They should have in mind this fact, crops have to be grown often with from 10 to 15 inches of rainfall, consequently every drop that falls on the farm must be utilized. Oft repeated cultivation is the secret of conservation of moisture. If crops are cultivated with the idea always in view utilizing all the rain that falls, they will come to maturity nad produce a satisfactory yield.

The disc harrow is one of the indispensable farm implements in the drier regions of our country. Ground that has been gone over with a disc harrow maintains what Campbell designates as a dust blanket, and the use of the disc should be made as often as the necessity offers to maintain the dust blanket. Loosening the surface is the principle benefit of the disc, and such treatment will not only conserve moisture, but it also puts the surface of the soil in condition for establishing the most favorable capillary conditions between it and the bottom of the furrow immediately after plowing. It is important also to have the drag follow the plow. If the ground is dragged immediately after plowing the soil particles can be easily fined and thus the first inch or inch and a half immediately becomes a dust blanket. A good capillary connection at the bottom of the furrow is necessary in order to bring the water from the subsoil near the surface where it is needed by the germinating seeds.

CONVENTION PROGRAM.

We hope to have the full program of the State Fruit Growers' Convention to be held at Riverside April 28, 29 30 and May 1, in next week's issue. Some great features are planned, and one of the most profitable of conventions ever held is promised.

Citrus fruits and their culture will be strong factors on the program and the orchards of Riverside are an education to the soil tillers. But citrus discussions will not exclude other important features. Some of the best talent of the north will add to the interest of the occasion.

One feature which will add to the attendance is the exceptionally low railroad fare. The best rate ever secured for a fruit growers' convention has been secured. Particulars next week.

Let every fruit grower plan to go.

WELCOME TO THE FLEET.

All California, and, in fact, all America joins in welcome to the greatest Armada which ever sailed about the world, back to home waters. When the news was flashed from San Diego Tuesday at one o'clock that anchors were dropped in home waters, bells rang, whistles and sirens blew and joy prevailed. Saturday afternoon all Los Angeles and Southern California generally will mass at the ocean front and shout and wave its welcome. Later Santa Barbara, Monterey and Santa Cruz. Then on May 6th San Francisco will extend another welcome. May the conquests of this fleet always be as successful as those it will make in California waters.

THE UNEMPLOYED.

There ought to be no scarcity o
the farmers this fall, because there a
men in cities who are anxious to find e
out on the ranch. Already the farm
ginning to call for help and the deman
will constantly increase as the season

In this connection let it be said it
remember that American help—we mea
in America—is better than immigran
cause it is more intelligent. It takes
educate the illiterate foreigners to do

Coachella has a rural postal delivery.

A new flour mill is to be erected at Fullerton.

These are busy days in the beet fields of Alamitos.

Highland will have a farmers' institute during May.

Simi valley is opening tracts of land for small farms.

One party has bored 24 wells in Perris during the past year.

Riverside claims a $2,000,000 hay and grain crop for this season.

Moorpark farmers are talking up plans for an irrigation plant.

Buaro pumping plants are busy pumping early irrigating water.

Oxnard beets planted some months ago are now in the best of condition.

The air of Southern California is heavy with orange blossom perfume.

Many new fire breaks are being constructed in the San Gabriel Forest Reserve.

A nurseryman at Brawley is planting 60,000 orange seedlings which will be budded another year.

It is estimated that one hundred acres will be planted to oranges this season on the Hemet tract.

Grain growers are wishing for the long-needed rain. It must come at once or it will be of no value.

Hay harvesting has begun in Imperial valley and the price has declined from $25 to $10 per ton.

New shipping sheds are being built at Imperial to be in readiness for the coming cantaloupe crop.

Bee Inspector Pleasants of Orange county examined over 700 stands of bees during February and March.

A rancher at Covina is suing the Covina Irrigation Company to compel it to furnish him with water.

The flood of the Colorado river is expected to be lower this year on account of lighter snowfall in the Rocky Mountains.

Southern California orange growers are inquiring what is meant by "California Brights" quoted as sold in Boston auctions.

San Bernardino and Riverside counties are alert to the fact that they must protect the forests on the water sheds of these counties.

North winds through some of the orange sections of Southern California took to the ground some of the riper navels and did slight damage.

Papers in Coachella Valley predict that alfa grass will revolutionize agricultural conditions of that section. It is used in the manufacture of paper.

The earliest shipments of cantaloupes ever made from Imperial valley was May 20th. This was before the bulk of the planting at Rocky Ford.

Many in Southern California are protesting against the lease granted by the government to a company of sheep owners for the use of San Clemente Island.

C. W. Leffingwell, Jr., who has so successfully managed the Leffingwell rancho for many years, has retired from its management in order to recuperate his health.

The Coast

Montana will observe Arbor Day on April 21st.

Mohair prices dropped 20 cents in Portland markets last week.

Corvalis, Oregon, will have a live stock show May 15th and 16th.

Seattle alfalfa hay has declined and is now being quoted at $8 per ton.

Stock growers of Montana will hold a convention at Miles City April 20th and 22nd.

A new apple district has been opened up in the Upper Hood River Valley, Or.

Large orders for fresh eggs from Alaska is stimulating the egg market at Portland.

A company has been formed at Bridgeport, Or., to irrigate the Port Columbia bar.

Seattle is predicting the greatest wheat crop which Washington has ever produced.

Sheep to the value of $1,400,000 were killed by coyotes in Eastern Oregon last year.

Wool growers of Oregon are appealing to the legislature to offer bounty for coyotes.

A large Oregon hop dealer predicts that prices next season will run between 9 and 10 cents.

Farmers of Eastern Oregon took keenest interest in attending the meetings of the fruit growers' special.

A recent order to the cattle men of Colorado to dip all cattle to rid them of the scabies, will cost them over $100,000.

The Grange at Moscow, Idaho, has placed orders for 150,000 sacks at a price which saved the ranchers over $3000.

Several thousand acres of land at Two Rivers, Washington, is soon to be subdivided and supplied with irrigation water.

Farmers in Garfield county, Colorado, have invested $10,000 in a flouring mill and will grind their own grain in the future.

Dairymen of Spokane met in session with inspectors of dairy foods and discussed matters of interest and ended with a banquet.

The government irrigation project in the Okanogan district in Eastern Washington, is nearing completion. It will reclaim 10,000 acres.

The managers of the Interstate Fair at Spokane plan for an agricultural gathering there this year which will rival the great State fairs of the East and Middle West.

The big factory of the Eastern Star Sugar Company at Glendale, Ariz., has been sold to the Detroit Trust Company. The price noted is approximately $1,000,000.

The granting of express freights to shippers of fruit in Washington, has enabled wider shipments of fresh fruits and as a local paper expresses it, allowed Northwestern fruit growers to compete with California.

Farmers in Washington find it a problem to learn how to get pasture on timber lands which have been cleared. A combination of blue grass, brome grass and orchard grass seems to work the most satisfactorily.

Profit in the Poultry Yar

We solicit short articles of a practical nature from the fancier and util breeder, giving their experiences with poultry. All inquiries pertaining to fee management, disease and its prevention will be answered through these columr

FERTILITY.

The humble egg hath virtues
  That in man we fail to see;
For like a thorn within the flesh,
  A man may often be too fresh,
An egg can never be!

AT THIS season of the year we hear a great deal about fertility. More than at any other season, for the reason many never stop to think of fertility until they get ready to set their eggs, and many even then don't stop to consider whether they have given their birds proper care and feed that should be given birds during the breeding season.

Only last week we were talking with a man who said he had bought a pen of birds at a long price; had give them the best care and feed, yet the eggs would not hatch. Said he believed that the stock was "no good," as the eggs would not hatch.

We explained as best we could some of the reasons why these eggs did not hatch. It was with this fancier as with many others who are breeding their first pen of thoroughbreds. They are so careful with them that they get them overfat; we have seen some people with their first pen feed them every time they went into the yard until they were so fat that they would hardly lay at all, then complain that thoroughbreds were no good. If you will keep your birds busy and not overfeed them you will find it will influence the fertility as well as the egg yield.

We quote from the Poultry Tribune on fertility:

We believe that infertility, as a rule, is due to one of two things, ignorance or gross indifference on the part of the breeder. The first is bad enough, but the complaint may be cured; if from the latter cause, the case is about hopeless. We have believed for years and we now feel positive that the breeder has the matter of fertility entirely within his own control. Fertility, like any other success in the poultry yard, depends not upon any one particular thing well done, but upon the carrying out of certain well planned details, which, for convenience in consideration, may be resolved into three groups, namely; robust health, congenial environment and proper food, assuming, of course, that common sense and good judgment have been exercised in the selection of a suitable number of birds for each breeding pen. The following number of females to each male in a pen is considered by many prominent breeders to be about the correct number: Leghorn, 15 to 20; (we think 12 to 15 are better.) Minorcas, 10 to 12; Plymouth Rocks and Wyandottes, 6 to 8; Cochins and Brahmas, 6 to 8; Orpingtons and Reds, 8 to 10.

The first two points of consideration—good health and comfortable surroundings—are so closely identified that one without the other is hardly probable. When the breeding pens are made up any bird with the appearance of ill health should be discarded. If those with the appearance of normal health are quartered in a comfortable house with plenty of sunlight they should be happy and contented and enjoy active, vigorous health, and that is the kind from which to expect fertile eggs. The modern poultry house, air tight or north, east and west, with open to the south, is ideal for lettin sunshine and fresh air so esse to the good health of the fowl. plenty of clean bright straw on floor and the sunlight and fres from the south, such matters wi found congenial to the birds and will be contented and thrive and continue in vigorous health if erly fed. Each pen should be plied with a shell box, a grit box a dusting box. The dust box sl be about four feet square, or 3x5 and should be kept half full of dust mixed with ashes or screene sand and ashes. For the mo meal we like whole wheat or scattered in the straw of the scr ing pen and at noon we give a of equal parts of bran, corn m shorts and scalded alfalfa mea mixing this mash it will be f most convenient to pour boiling w into a bucket, salt and pepper water, using red pepper, and stir a big iron spoon, then add the and stir into a crumbly mass. we are ready for the alfalfa which should be thoroughly w with boiling water fifteen or tw minutes before needed. Take part of the alfalfa to two parts o mash and mix them and feed clean trough in the proportion of quart to every twelve birds, si as a guide. Some pens require than others. Feed all they will in ten or fifteen minutes. When birds have eaten the mash we ready for what we consider the important item of menu for get fertile eggs, namely, well cooked meat ground up in a food cho three or four handfuls to each fed in the trough. If the meat is before the mash, the mash wil main uneaten, but even after the is full of mash, they will eat meat. See that there is alwa plentiful supply of fresh water, under such conditions and with treatment, there need be little a hension of infertility. In the eve feed whole corn, barley or wheat nately.

AROUND THE YARDS.

Vigor in the flock means eggs.

* * *

An infertile egg will not rot smell.

* * *

Inbreeding and loss of conditio frequent causes of infertile eggs

* * *

Dark-shelled eggs have proved er to test for fertility than shelled ones.

* * *

Have a system in feeding, bu that system contain as much of riety as possible.

* * *

Fowls should not be confined more than is necessary, unless are being fattened.

* * *

Eggs from pullets, unless the are well matured, are not often factory for sitting. They are infertile, and if they do hatch, chicks are puny.

for laying hens. I can get beef scraps for four cents per pound and ground bone for five cents per pound. Which do you consider the cheaper? —B.

Green bone is the best food that can be given poultry, especially laying hens. It should be fed before it gets musty or tainted. Unless you can feed it fresh, beef scraps are better. Beef scraps are good, but we always had better results with green bone.

* * *

Incubator Room.

I contemplate building an incubator room, walls and ceiling filled with four inches of saw dust. Please tell me the best way to ventilate it? Would it be better without a window? Do eggs hatch better in a dark room? Would the ground do as well as lumber for a floor? Room 14x20 feet.—G. W. P., Hollister.
